## EXECUTIVE SUMMARY

### Project Description and Trip Generation

The Traffic Impact Analysis (TIA) presents an evaluation of the potential impacts associated with the proposed mixed-use development at 190 W. Cliff Drive in the City of Santa Cruz, California. The project site is currently occupied by a private surface parking lot, which is used exclusively by the existing Dream Inn and Aquarius Restaurant (east side of W. Cliff Drive). The project will remove the existing parking lot and develop the following residential and commercial uses with a subterranean parking structure:

- 89 Residential Condominiums (10 Affordable Units)
- 8,265 Square Foot (SF) of General Retail Space
- 7,525 SF of Restaurant / Food & Beverage
- 1,646 SF of Office Space
- 421 Parking Stalls on 3 Levels

It is estimated that the project uses will generate approximately 1,500 new weekday trips and 1,304 new daily trips on a typical Saturday (131 trips during the weekday PM peak hour and 137 new trips during the Saturday mid-day peak hour). Project access will be provided via driveways on W. Cliff Drive and Bay Street. The project driveway on W. Cliff Drive will be restricted to right-turns only (in and out). The project will construct frontage improvements to improve pedestrian and bicycle mobility and safety.

### TIA Scope and Data, and Existing Conditions

The TIA scope includes an evaluation of the potential project impacts on local intersections during an average weekday PM peak hour and a Saturday mid-day (MD). To document existing conditions at the study intersections new traffic count data was collected in April 2017 (local schools and UCSC in session), August 2017 (local summer conditions), and November 2018. The evaluation of existing conditions indicates that average delays at a majority of the study intersections are currently within acceptable limits, as defined by the City of Santa Cruz (Level of Service D or better). However, average delays at the W. Cliff Drive and Bay Street intersection are currently within the “Level of Service” (LOS) E range during weekday PM peak hour. In addition, the existing peak hour traffic volumes at this intersection currently exceed the minimum signal warrant criteria (2014 Manual on Uniform Traffic Control Devices).

### Project Improvements and Existing Plus Project Conditions

In coordination with City staff, the project applicant is also proposing to design and construct certain improvements at the W. Cliff Drive and Bay Street intersection as part of the project to improve traffic flows and pedestrian and bicycle safety. The project improvements at the W. Cliff Drive and Bay Street would be constructed and operational prior to occupancy of the project site. Two (2) improvement variants were identified and evaluated in order to understand the “pros” and “cons” associated with each variant. Variant No. 1 would include the installation of traffic signal control and Variant No. 2 would include the construction of a mini-roundabout. The evaluation of existing plus project traffic conditions

indicates that with the implementation of either variant the W. Cliff Drive and Bay Street intersection would operate in the LOS A (Variant No. 2, mini-roundabout) or LOS B (Variant No. 1, signal control) range during the weekday PM and Saturday MD peak hours. The analysis of existing plus project conditions also concluded that the project traffic will not significantly impact peak hour operations at the other study intersections.

#### Cumulative (General Plan 2030) Conditions

The TIA includes an evaluation of cumulative conditions, which reflect forecast growth documented in the General Plan 2030 EIR. The General Plan 2030 buildout scenario includes the long-range growth anticipated for the University of California Santa Cruz (UCSC). The City has identified the improvements to address existing and future deficiencies and accommodate long range growth. These improvements are generally funded through the City's Traffic Impact Fee (TIF) Program (which provides mitigation for the General Plan), gas tax funds and transportation grants, and are commonly programmed as part of the City's Capital Investment Program (CIP). The cumulative analysis was conducted assuming the installation of the TIF / CIP improvements at the study intersections.

The cumulative analysis indicates that average vehicle delays at the study intersections will be within acceptable limits during the weekday PM peak hour, except at the Mission Street (SR 1) and Bay Street intersection. The General Plan 2030 EIR acknowledges that future LOS at this intersection will remain at unacceptable levels. It's stated that the General Plan 2030 accepts lower LOS at major regional intersections. The project traffic will comprise less than 1% of the total cumulative peak hour traffic demands at the Mission Street (SR 1) and Bay Street. The implementation of either improvement variant at the W. Cliff Drive and Bay Street intersection would provide operations in the LOS A (Variant No. 2, mini-roundabout) or LOS B (Variant No. 1, signal control) range during the weekday PM peak hour. Payment of the City's TIF serves as the project's "fair-share" contribution towards the funding of future intersection improvements necessary to maintain and/or achieve acceptable traffic operations at the traffic impact fee intersections.

#### Comparison of Variant Improvement Alternatives

The TIA also includes an overview comparison (pros and cons) of traffic signal control verses a mini-roundabout at the W. Cliff Drive and Bay Street intersection. The mini-roundabout concept was developed and analyzed by MSA Professional Services (Ourston Roundabout Team). The MSA (Ourston) findings suggest that each alternative carries costs and benefits. The traffic signal alternative (Variant No. 1) would provide better intersection performance, longer waits for pedestrians and bikes, and slightly longer delays for vehicles during peak periods. The mini-roundabout alternative (Variant No. 2) would provide improved corridor performance during non-peak periods and less delay during peak periods as compared with traffic signal control (Variant No. 1). Variant No. 2 also provides less delay for bikes and pedestrians and slower vehicle speeds through the intersection. Microsimulation models were also prepared to supplement the LOS analysis and provide a qualitative comparison of the traffic control alternatives with greater consideration for bicycle and pedestrian demands and conflicts. The results of MSA (Ourston) microsimulation modeling and a summary of their findings is provided in Section 6.0 (Conclusions and Recommendations).

## 1.0 INTRODUCTION

The Traffic Impact Analysis (TIA) presents an evaluation of the potential impacts associated with the proposed mixed-use development at 190 W. Cliff Drive in the City of Santa Cruz, California. The project site is located on the northwest corner of the Bay Street and W. Cliff Drive intersection. A private surface parking lot is currently located on the project site, which is used exclusively by the Dream Inn and Aquarius Restaurant (east side of W. Cliff Drive opposite the project site). The proposed project includes various residential and commercial uses. The general location of the project site is shown on Figure 1.

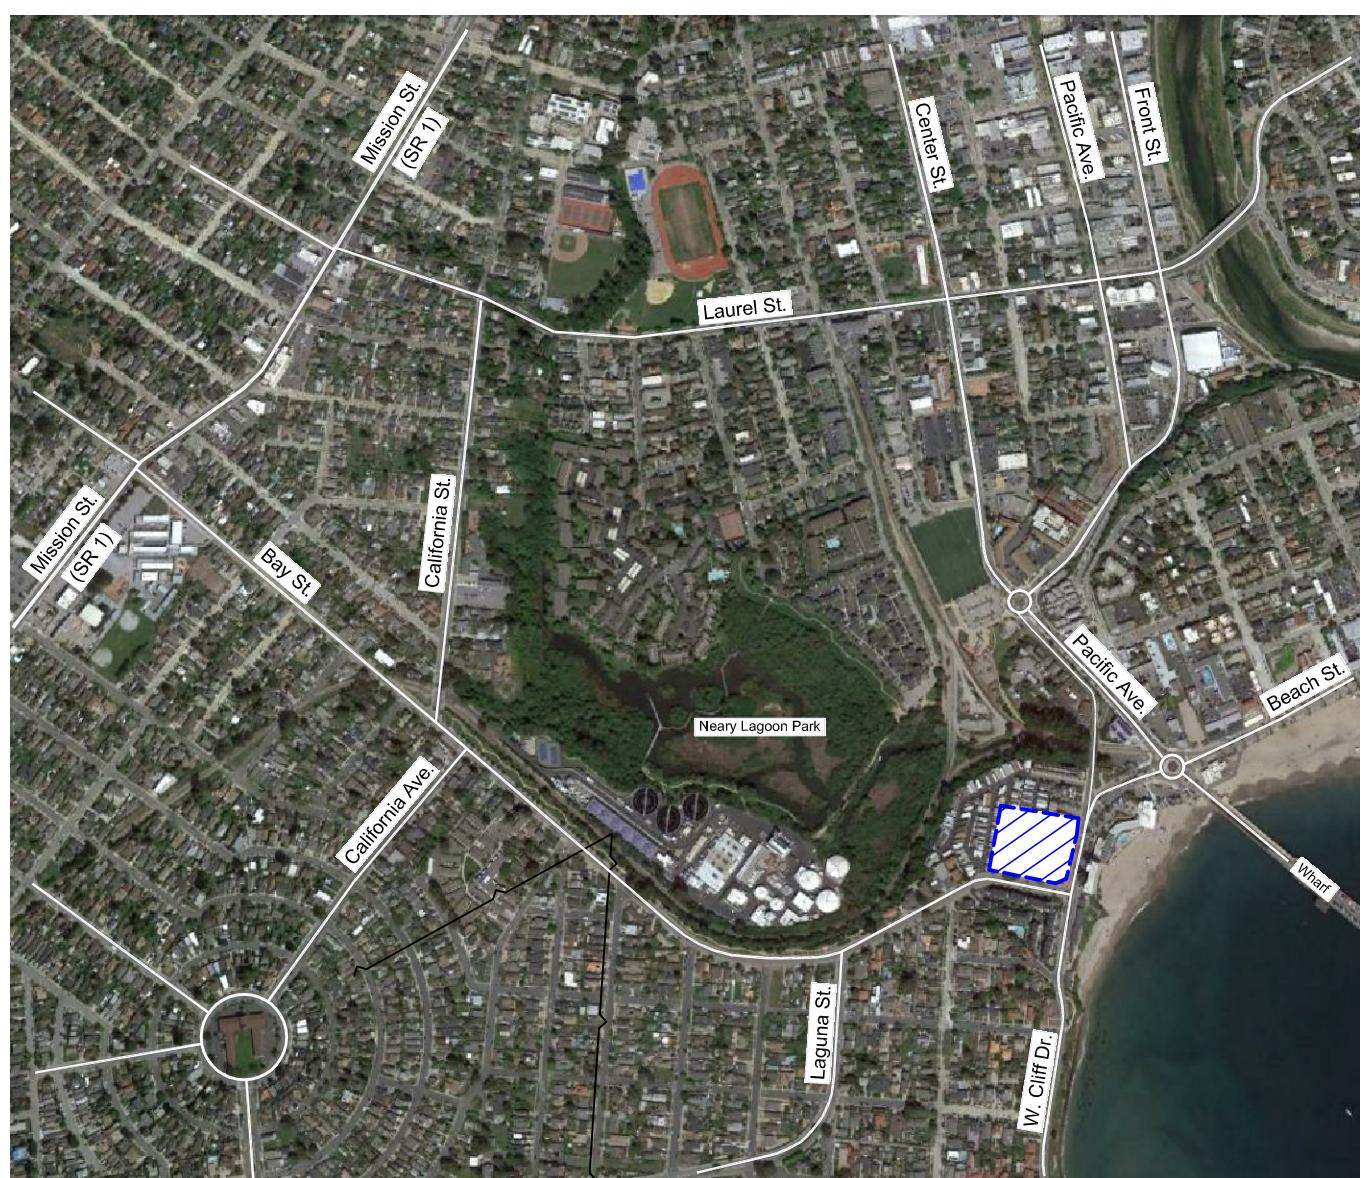

The TIA scope was developed in consultation with City staff. The initial phase of the TIA included the preparation of a preliminary trip generation and parking analysis. The trip generation analysis provided a preliminary estimate of the new vehicle trips associated with the proposed uses and quantified the number of project trips at local intersections. The parking analysis was conducted to verify that the proposed parking would be adequate to accommodate existing and future parking demands associated with “post” project conditions. The TIA presents an evaluation of the potential project impacts at the following seven (7) study intersections:

- Mission Street (SR 1) / Bay Street (#2923)
- Bay Street / California Avenue (#2943)
- W. Cliff Drive / Beach Street (#2967)
- Pacific Avenue / Center Street (#2964)
- Bay Street / California Street (#2944)
- W. Cliff Drive / Bay Street (#2965)
- Pacific Avenue / Beach Street (#2966)

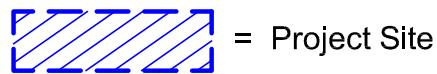

At the request of City staff, an overview comparison of traffic signal control versus a mini-roundabout at the W. Cliff Drive / Bay Street intersection is also included in the TIA. The analysis focuses on operations during an average weekday afternoon (PM) peak hour and mid-day (MD) peak hour on a Saturday. New traffic count data was collected at the study intersections to document existing condition. New 24-hour traffic count data was also collected to determine the average daily traffic (ADT) on the following roadway segments:

- Bay Street, west of W. Cliff Drive
- W. Cliff Drive, south of Bay Street
- W. Cliff Drive, north of Bay Street

The initial traffic count data was collected in April 2017, which reflects average conditions when local schools and the University of California Santa Cruz (UCSC) were in session. At the request of the project applicant, additional traffic count data was collected in August 2017 to document summer conditions during the last of the summer tourism season. The TIA provides a comparison of the April and August traffic count data collected in April and August 2017. Additional peak hour traffic count data was also collected at the W. Cliff Drive / Bay Street intersection in November 2018 to document current conditions adjacent to the project site. The project parking analysis is presented in a separate report.

LOCATION MAP

## 2.0 REGULATORY SETTINGS

This section summarizes the federal state, regional, and local programs and plans that apply to the project.

### Federal Regulations

#### Americans With Disabilities Act of 1990

The Americans with Disabilities Act of 1990 (ADA) (revised 2010) prohibits discrimination based on disability. In particular, Title III of the ADA prohibits discrimination on the basis of disability in “places of public accommodation” (businesses and non-profit agencies that serve the public) and “commercial facilities” (other businesses).

Appendix 3.3-A to Part 36 (Standards for Accessible Design) of the ADA establishes minimum standards for ensuring accessibility for the disabled in the design and construction of a new facility or alteration of an existing facility, including roadways, parking lots, and sidewalks. Examples of key guidelines include detectable warnings for pedestrians when entering traffic where there is no curb, a clear zone of 48 inches for the pedestrian travel way, and a vibration-free zone for pedestrians.

### State Regulations

#### Senate Bill 375

The Sustainable Communities and Climate Protection Act (SB 375) requires California Metropolitan Planning Agencies (MPOs) to create a Sustainable Communities Strategy (SCS) that identifies the locations and types of development necessary to lower vehicle miles traveled and meet greenhouse gas emission reduction targets. The law has four major components: (i) requires regional greenhouse gas emissions targets for cars and light trucks; (ii) MPOs are required to create a Sustainable Communities Strategy (SCS) that provides a plan for meeting regional targets; (iii) regional housing elements and transportation plans must be synchronized on 8-year schedules, and Regional Housing Needs Assessment (RHNA) allocation numbers must conform to the SCS; and (iv) MPOs must use transportation and air emissions modeling techniques that are consistent with the guidelines prepared by the CTC (Regional Transportation Planning Agencies, cities, and counties are encouraged, but not required, to use travel demand models that are consistent with California Transportation Commission guidelines).

#### Complete Streets (AB 1358)

The California Complete Streets Act of 2008 (AB 1358) requires cities and counties to include “complete street” policies in their general plans, which address the safe accommodation of all users, including bicyclists, pedestrians, motorists, public transit vehicles and riders, children, the elderly, and the disabled. These policies can apply to new streets as well as the redesign of corridors.

**SB 743**

SB 743 requires the Governor's Office of Planning and Research (OPR) to amend the CEQA Guidelines to provide an alternative to LOS for evaluating transportation impacts. The law is designed to eliminate auto delay, level of service (LOS), and other similar measures of vehicular capacity or traffic congestion as a basis for determining significant impacts. The intent of SB 743 is to change current practice in order to balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions.

The Governor's Office of Planning and Research (OPR) has issued draft guidance and recommends use of automobile Vehicle Miles Traveled, or VMT, as the preferred CEQA transportation metric, along with the elimination of auto delay for CEQA purposes. Accordingly, each jurisdiction will need to set new thresholds for transportation impacts based on VMT. Further, parking impacts will not be considered significant impacts on the environment for select development projects with nearby frequent transit service.

**Local and Regional Regulations**

A number of local, regional and state agencies are involved with transportation planning and implementation of transportation programs and improvements within the City. For example, while the City maintains local roadways and transportation facilities, the California Department of Transportation (Caltrans) has jurisdiction over State highway segments, including portions of Routes 1, 9, and 17.

Other local and regional agencies responsible for transportation services and/or transportation planning are summarized below:

**Association of Monterey Bay Area Governments**

The Association of Monterey Bay Area Governments (AMBAG) is the federally designated MPO for the tri-county Monterey Bay region (Santa Cruz, Monterey and San Benito counties). AMBAG is responsible for developing and administering plans and programs to maintain eligibility and receive federal funds for the transportation systems in the region, including the Metropolitan Transportation Plan (MTP), the Metropolitan Transportation Improvement Program (MTIP), maintenance of a regional travel demand model and demographic forecasts. Further, AMBAG works with regional transportation planning agencies, transit providers, the Monterey Bay Unified Air Pollution Control District (MBUAPCD), state and federal governments, and organizations having interest in or responsibility for transportation planning and programming.

**Santa Cruz County Regional Transportation Commission (SCCRTC)**

The Santa Cruz County Regional Transportation Commission (SCCRTC) is the State designated Regional Transportation Planning Authority (RTPA) for transportation planning activities in Santa

Cruz County. SCCRTC oversees planning and funding programs for local and countywide projects within Santa Cruz County using state and federal transportation funds. The City of Santa Cruz has one City representative on the 12-member SCCRTC board and some City transportation projects are funded through grant programs administered by the SCCRTC.

### **Santa Cruz Metropolitan Transit District**

The Santa Cruz Metropolitan Transit District (SCMTD) provides transit services throughout Santa Cruz County.

### **Santa Cruz General Plan 2030**

Chapter 5 of the City's General Plan sets forth the City's circulation policies. The Chapter provides the existing conditions, the challenges and problems facing the City's road system, and the goals, policies, and actions that guide decisions related to the City's transportation and road systems. Relevant goals and policies are listed below.

#### **Goals:**

- Goal M1 - Land use patterns, street design, parking, and access solutions that facilitate multiple transportation alternatives (Cf. LU4 LU4.1.1, LU4.2, ED1.9.2, and M2.2, 2.3.2, and 3.1.9)
- Goal M2 - A safe, sustainable, efficient, adaptive, and accessible transportation system
- Goal M3 - A safe, efficient, and adaptive road system
- Goal M4 - A citywide interconnected system of safe, inviting, and accessible pedestrian ways and bikeways

#### **Policies:**

- M1.1 Reduce automobile dependence by encouraging appropriate neighborhood and activity center development. Cf. ED5.1, LU4.2; and M1.5.1, M2.4.2, 3.1.2, and 4.3.
- M1.3 Create pedestrian-friendly frontage and streetscapes and attractive pedestrian-oriented areas. Cf. CD4.2, 4.2.1, 4.3.1, 5.2.
- M3.1 Acknowledge and manage congestion.
- M3.2 Ensure road safety for all users.
- M4.1 Enable and encourage walking in Santa Cruz. Cf. CD5.1, CC8.4, PR4.1.2.
- M4.5 Support pedestrian and bicycle safety improvements.

### 3.0 EXISTING CONDITIONS

The local roadway network serving the project site includes Mission Street (Cabrillo Highway - State Route 1), Bay Street, W. Cliff Drive, Beach Street, Pacific Avenue, Center Street, and various collector streets (e.g. California Street, California Avenue, Laguna Street, Front Street, etc). The following is a brief description of the local network and an evaluation of existing traffic operations.

#### Network Description

Mission Street (State Route 1) provides coastal access between Northern and Southern California. Through Santa Cruz County, State Route 1 (SR 1) has a freeway section south of SR 17 and grade separated interchanges at Morrissey Boulevard, Soquel Drive, 41 Street, etc. North of SR 17, SR 1 continues as Cabrillo Highway and follows Mission Street west of Chestnut Street. Mission Street (SR 1) through this portion of the City has two (2) travel lanes in each direction, with a posted speed limit of 25 miles-per-hour (mph). Mission Street (SR 1) is signalized at Bay Street and has exclusive left turn lanes at local intersections (Walnut Avenue, Laurel Street, Bay Street, Almar Avenue, etc). There are pedestrian crosswalks on Mission Street (SR 1) at various locations north and south of Bay Street (Van Ness Avenue, Olive Street, etc). On-street parking is prohibited along the majority of Mission Street (SR 1).

Bay Street extends south from the UCSC campus entrance at High Street to W. Cliff Drive. Between Mission Street (SR 1) and W. Cliff Drive, Bay Street has a single travel lane in each direction and posted speed limit of 30-mph. The Bay View Elementary School is located on the corner of the Mission Street (SR 1) / Bay Street intersection. The California Street approach at Bay Street is stop sign controlled. The Bay Street / California Avenue intersection is “all-way” stop controlled. There are Class II bike lanes between Mission Street (SR 1) and W. Cliff Drive. There are pedestrian crosswalks on Bay Street at various locations (Seaside Street, California Street, California Avenue, and between California Avenue and Continental Street). There is also a recreational path along the north / east side of Bay Street, between California Street and Laguna Street. On-street parking is permitted along various sections of Bay Street. The existing project site driveway on Bay Street is currently closed (gated) with no access to the surface parking lot.

W. Cliff Drive extends south of the Pacific Avenue / Center Street intersection with a single southbound lane (one-way). There is a short northbound left turn lane at Beach Street for access to the West Cliff Inn Hotel and residential neighborhood on the west side of W. Cliff Drive. W. Cliff Drive continues south of Beach Street along the coastline with a single lane in each direction and posted limit of 25-mph. The Dream Inn has an inbound only driveway on W. Cliff Drive just north of Bay Street. The Dream Inn driveway north of the mid-block crosswalk is outbound only. There are bike facilities on the section between Beach Street and Bay Street (Class II on west side and Class 4 Cycle Tracks on east side). Pedestrian crosswalks are located at the Bay Street and Beach Street intersections, and south of the Dream Inn driveway. There is a shared bicycle-pedestrian path on the east side of W. Cliff Drive, south of Bay Street. On-street parking is prohibited on W. Cliff Drive north of Bay Street.

Beach Street east of W. Cliff Drive provides access to the Santa Cruz Wharf and Beach Boardwalk. Between W. Cliff Drive and Pacific Avenue, Beach Street has bike facilities (Class II on north side and Class 4 Cycle Tracks on south side) and on-street parking (both sides of the westbound lane). A roundabout provides traffic control at the Beach Street / Pacific Avenue intersection (Wharf entrance / exit). East of Pacific Avenue, traffic is restricted to one-way (eastbound) towards the Beach Boardwalk. Pedestrian crosswalks are located at the W. Cliff Drive and Pacific Avenue intersections. On-street parking is provided on the north side of Beach Street, east of Pacific Avenue.

Pacific Avenue extends northwest of Beach Street (opposite the Wharf entrance / exit) with a single lane in each direction. Pacific Avenue then continues on a northeast alignment from Center Street (opposite the Depot Park entrance). Between Front Street and Center Street, Pacific Avenue has Class II bike lanes and on-street parking. A roundabout provides traffic control at the Pacific Avenue / Center Street intersection. Pedestrian crosswalks are located at the Beach Street, Front Street, 2<sup>nd</sup> Street, and Center Street intersections.

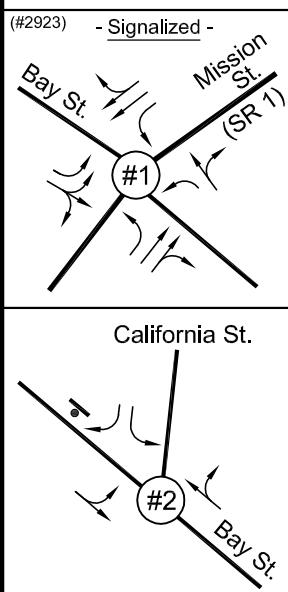

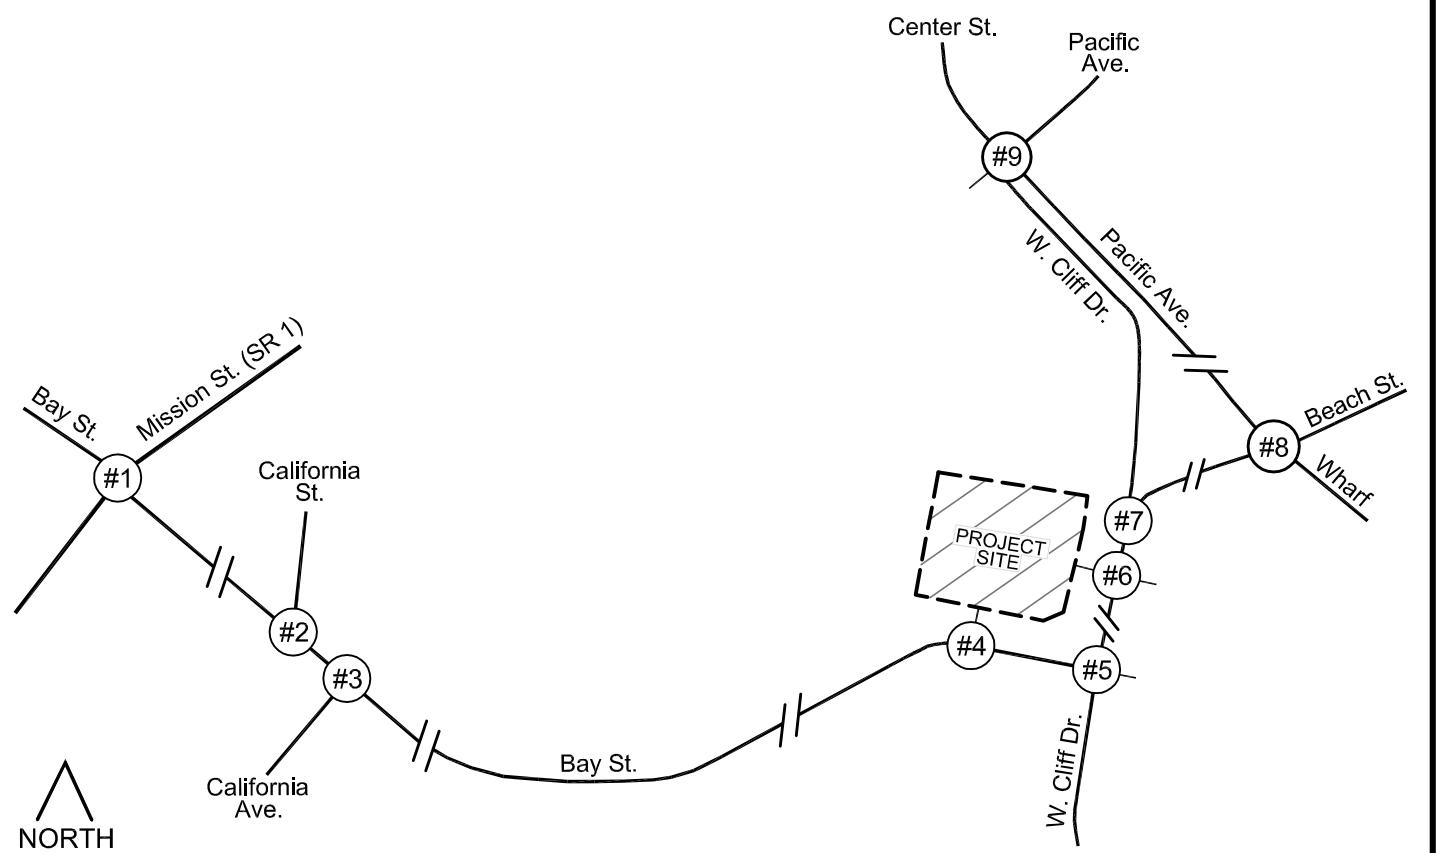

The existing traffic control and approach lane geometrics at the study intersections are graphically illustrated on Figure 2A.

## Transit and Rail Facilities

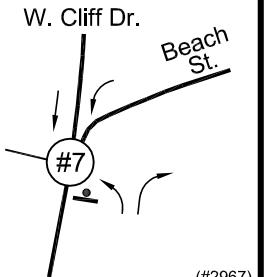

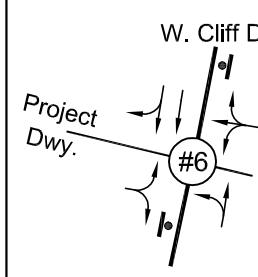

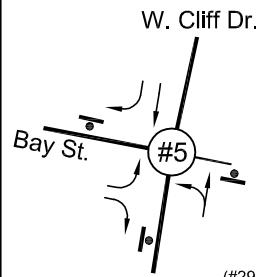

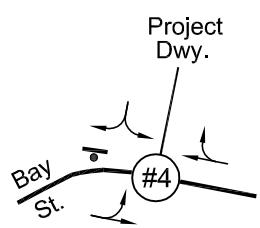

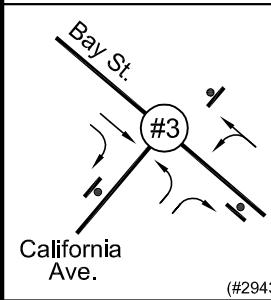

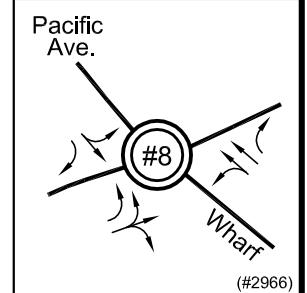

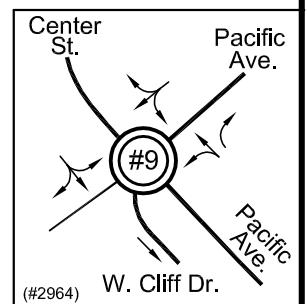

The Santa Cruz Metropolitan Transit District (SCMTD) has bus route service along Mission Street (SR 1), Bay Street, W. Cliff Drive, Beach Street and Pacific Avenue. Local SCMTD bus stops are located on Bay Street, just west of W. Cliff Drive (Routes 3, 19 and 20). Amtrak transit service is available at the Santa Cruz Metro Center on Pacific Street. The Santa Cruz Big Trees & Pacific Railway Company also provides scenic trips through the Santa Cruz Mountains and along the coast. There are gated railroad track crossings at the Pacific Avenue / Beach Street intersection.

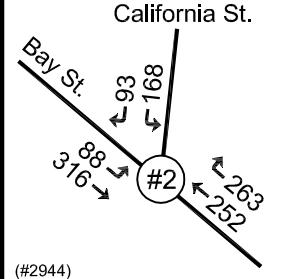

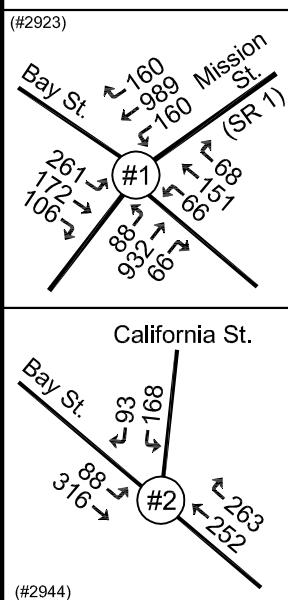

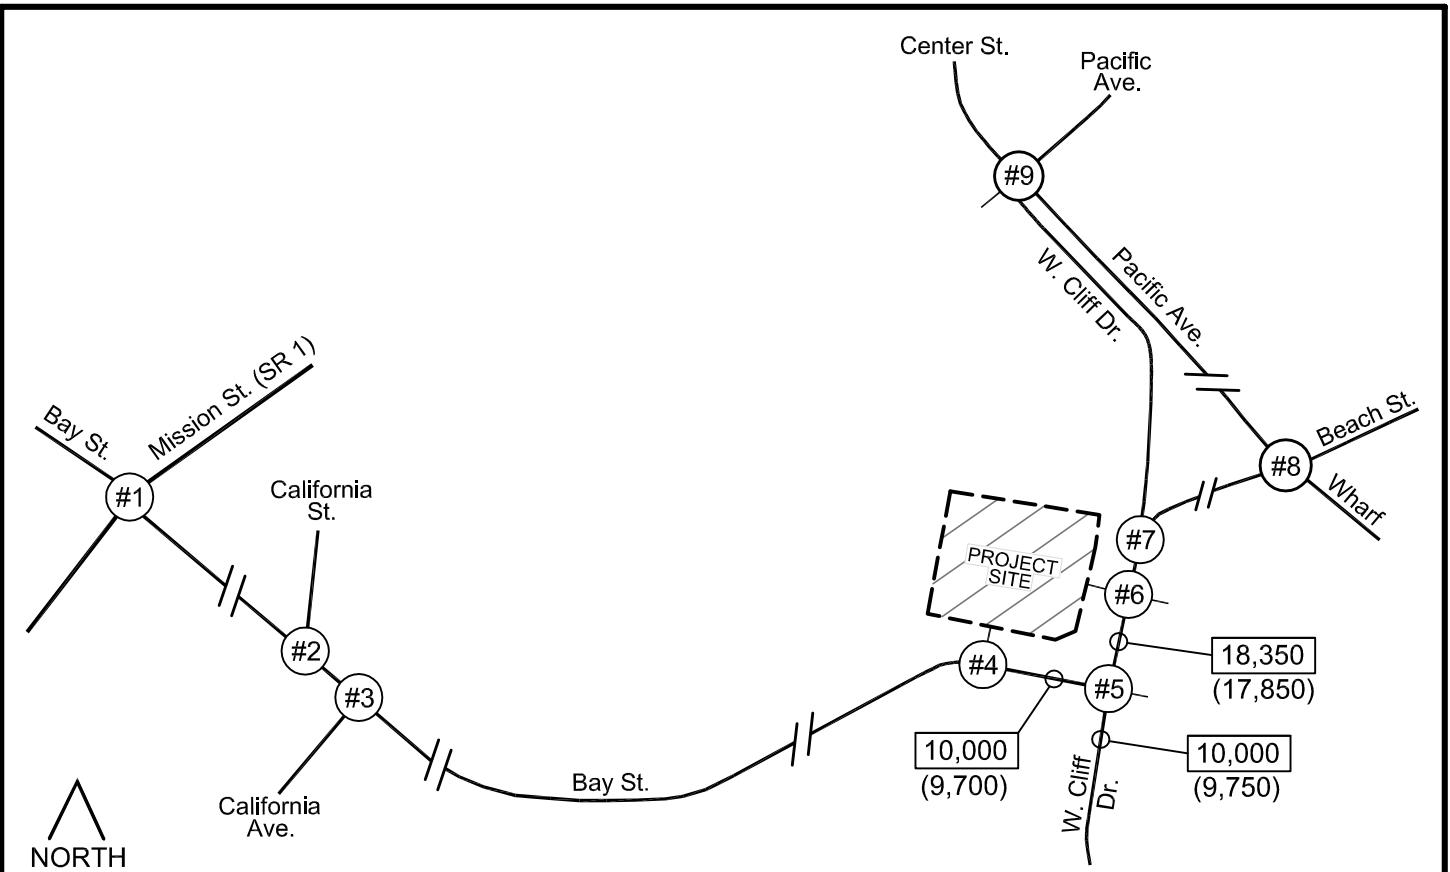

## Traffic Volumes (April 2017)

As previously discussed, new traffic count data was collected to document existing conditions. The data collection includes vehicular, bicycle and pedestrian traffic counts. As previously stated, the initial traffic count data was collected in April 2017. The data was collected on average weekdays (April 13<sup>th</sup> & 18<sup>th</sup>) during the afternoon commuter peak period (4:00-6:00 PM) and on the Saturday before Easter Sunday (April 15<sup>th</sup>) during the mid-day peak period (1:00-3:00 PM). The pedestrian and bicycle counts were also conducted on Saturday (April 15<sup>th</sup>) between 10:00 AM and 6:00 PM. The 24-hour roadway segment data was collected for a 10-day period (April 14<sup>th</sup> - 23<sup>rd</sup>). Though additional data was collected in August, it was deemed appropriate to analyze the project impacts using the April base-line data since local schools and UCSC were in session. The City's General Plan 2030 traffic model projections used for the cumulative analysis also include traffic associated with UCSC. The existing weekday traffic volumes are illustrated on Figure 2B, with the existing Saturday traffic volumes shown on Figure 2C. Copies of the study intersection and roadway segment traffic count data are included in Appendix A. A summary roadway segment count data is also included in Appendix A.

## Intersection Level of Service Analysis (April 2017)

Various “level of service” (LOS) methodologies are used to evaluate traffic operations. Operating conditions range from LOS “A” (free-flowing) to LOS “F” (forced-flow). The City of Santa Cruz has adopted the LOS D standard as the lower limit for acceptable operations. Caltrans endeavors to maintain a target LOS at the transition between LOS C and D on State highway facilities (Guide for the Preparation of Traffic Impact Studies, 2002). Therefore, the LOS D threshold standard is used to evaluate operating conditions at the study intersections. A brief description of the LOS values is included in Appendix B.

The evaluation of “peak hour” traffic operations at intersections is based on various methodologies outlined in the 2010 Highway Capacity Manual (HCM). The methodologies analyze operations based on vehicle “control” delay. Control delay is the principal service measure for evaluating LOS at intersections. Control delay includes the delay associated with vehicles slowing in advance of an intersection, time spent stopped on an intersection, time spent as vehicles move up in the queue, and time needed for vehicles to accelerate to their desired speed. Delays for signalized intersections are evaluated for the overall peak hour as an “average.” The methodologies for un-signalized intersections also evaluates the delays for the each “critical” movement (e.g. stop sign controlled approaches on the minor street and main line left turn). Table 1 presents the LOS and vehicle delay criteria for signalized and un-signalized intersections.

Table 1 - LOS and Vehicle Delay Criteria

LOS Value	Intersection Control Type	
	Signalized Control	Two-Way & All-Way Stop Sign Control
	Control Delay per Vehicle (seconds / vehicle)	
A	< or = 10	0 - 10
B	> 10 - 20	> 10 - 15
C	> 20 - 35	> 15 - 25
D	> 35 - 55	> 25 - 35
E	> 55 - 80	> 35 - 50
F	> 80	> 50

The Synchro 9 software was used to perform the LOS analysis at the study intersections. The HCM software (HCS7) was used to evaluate the LOS at the roundabout study intersections. The results of the existing intersection LOS analysis are presented in Table 2. It's again noted that the evaluation of existing conditions was conducted using the April 2017 base-line data since local schools and UCSC were in session. As stated previously, the existing project driveway on Bay Street is currently closed, and therefore, no traffic count data was collected. The Bay Street / Project Driveway intersection is non-operational under existing conditions. Copies of the Synchro and HCS7 worksheets are included in Appendix B.

Table 2 - Existing Intersection LOS Analysis (April 2017)

Study Intersection	Average Delay - LOS Value (a)	
	Weekday PM Peak Hour	Saturday MD Peak Hour
Mission St. (SR 1) / Bay St. (Signalized)	36.7 - D	29.6 - C
Bay St. / California St. (SB Stop Sign)	8.7 - A (36.6 - E)	9.9 - A (34.2 - D)
Bay St. / California Ave. (All-Way Stop)	15.5 - C	14.7 - B
W. Cliff Dr. / Bay St. (All-Way Stop)	38.0 - E (b)	24.2 - C
W. Cliff Dr. / Beach St. (NBLT Stop Sign)	0.3 - A (9.8 - A)	0.4 - A (10.1 - B)
Pacific Ave. / Beach St. (Roundabout)	5.5 - A	6.3 - A
Pacific Ave. / Center St. (Roundabout)	7.9 - A	10.8 - B

(a) Highest stop sign controlled approach delay reported in parenthesis

(b) Existing LOS based on November 2018 traffic count data

The data in Table 2 indicates average delays at a majority of the study intersections are currently within acceptable limits during both existing conditions scenarios (weekday PM and Saturday MD peak hour periods), as defined by the City of Santa Cruz (LOS D or better). However, average delays at the W. Cliff Drive / Bay Street intersection are currently within the LOS E range during weekday PM peak hour. The Mission Street (SR 1) / Bay Street intersection operates within the Caltrans LOS C/D target transition (LOS C to mid-level LOS D). The analysis also estimates delays in the LOS E range for the stop sign controlled approach on California Street at Bay Street (Weekday PM Peak Hour). However, it's noted that the LOS analysis software can over-estimate delays, and therefore, may over estimate delays on California Street and not accurately reflect the gaps in east-west traffic on Bay Street created by the "all-way" stop control at California Avenue.

### Traffic Signal Warrants (April 2017)

A signal warrant analysis was conducted for the existing conditions at the three (3) stop sign controlled intersections (Bay Street at California Street, California Avenue and W. Cliff Drive). Criteria in the 2014 California Manual on Uniform Traffic Control Devices (MUTCD) was used for the signal warrant analysis. Existing peak hour traffic volumes at the Bay Street / California Street and Bay Street / California Avenue intersections do not exceed the minimum "peak hour volume" warrant criteria (Warrant #3). However, existing volumes at the W. Cliff Drive / Bay Street intersection (weekday PM and Saturday MD peak hour periods) do exceed the minimum MUTCD warrant criteria (Warrants #1, #2 and #3). Copies of the traffic signal warrant analysis volume data and MUTCD graphs are provided in Appendix C.

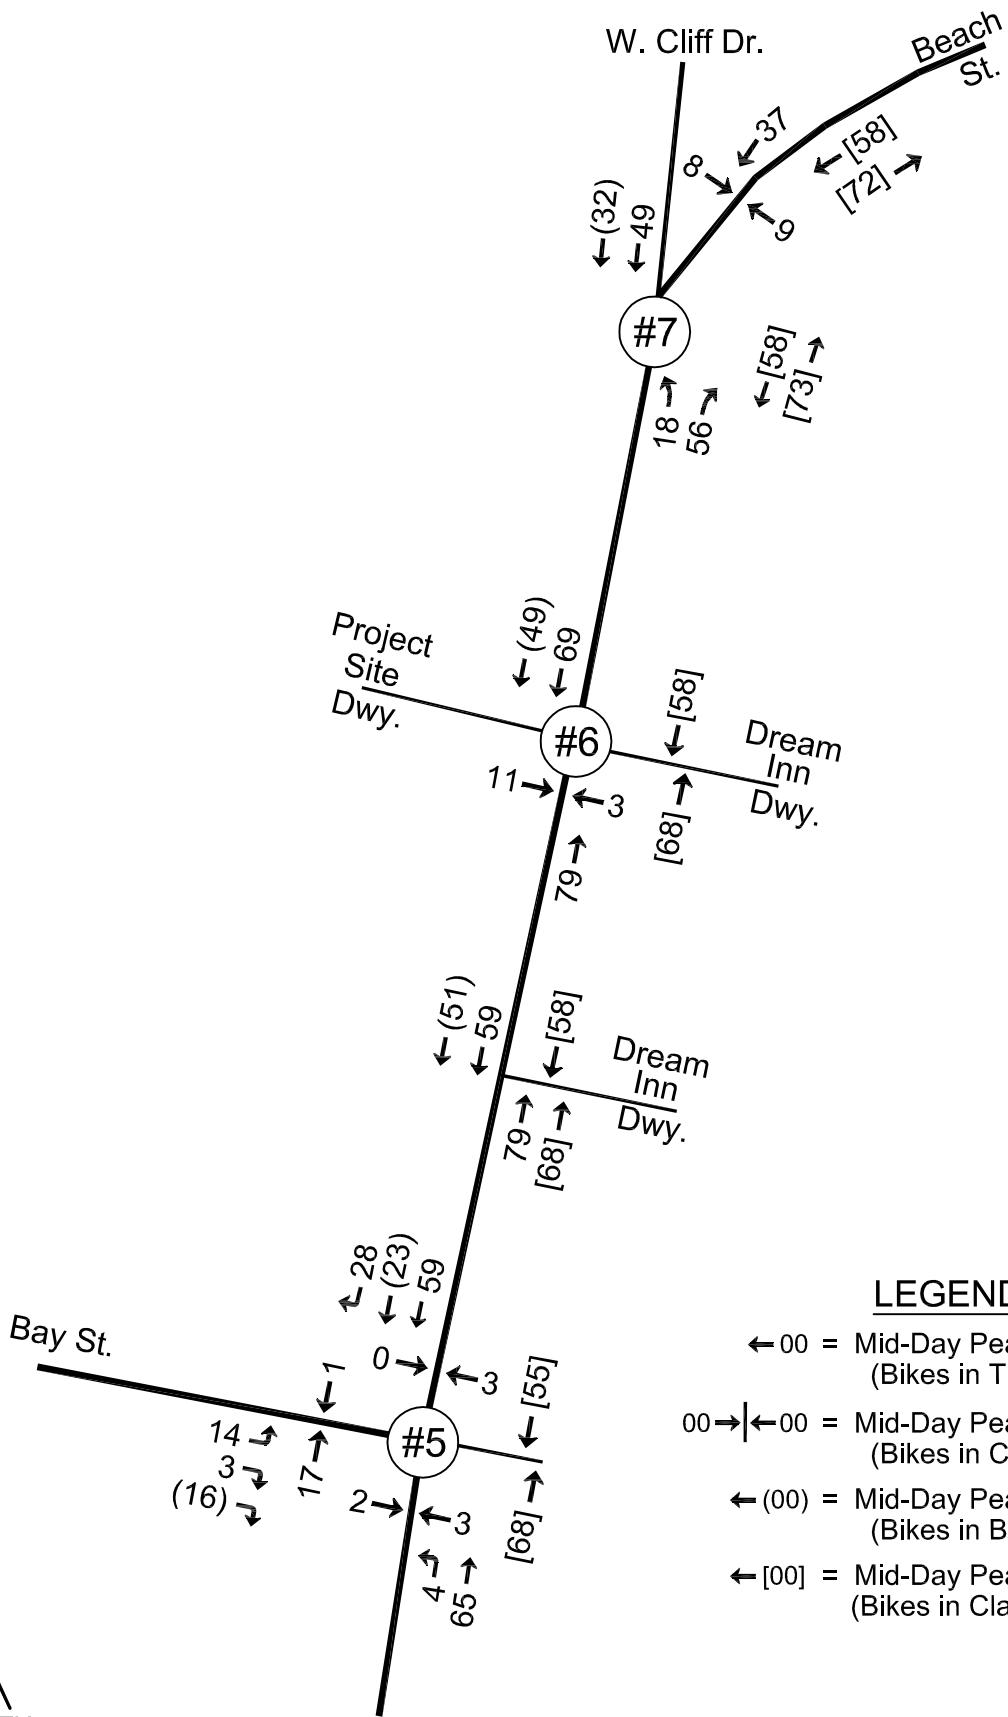

## Bicycle and Pedestrian Volumes (April 2017)

As previously stated, bicycle and pedestrian traffic count data was collected on a Saturday in April and August at the study intersections along W. Cliff Drive (10:00 AM - 6:00 PM). The bicycle data included the bike traffic in the designated bike facilities, crosswalks, and vehicular lanes. The bicycle traffic volumes are illustrated on Figure 2D. During the field observations bikes were observed transitioning between the designated bike facilities and vehicular travel lanes. Copies of the bicycle and pedestrian count data are included in Appendix A.

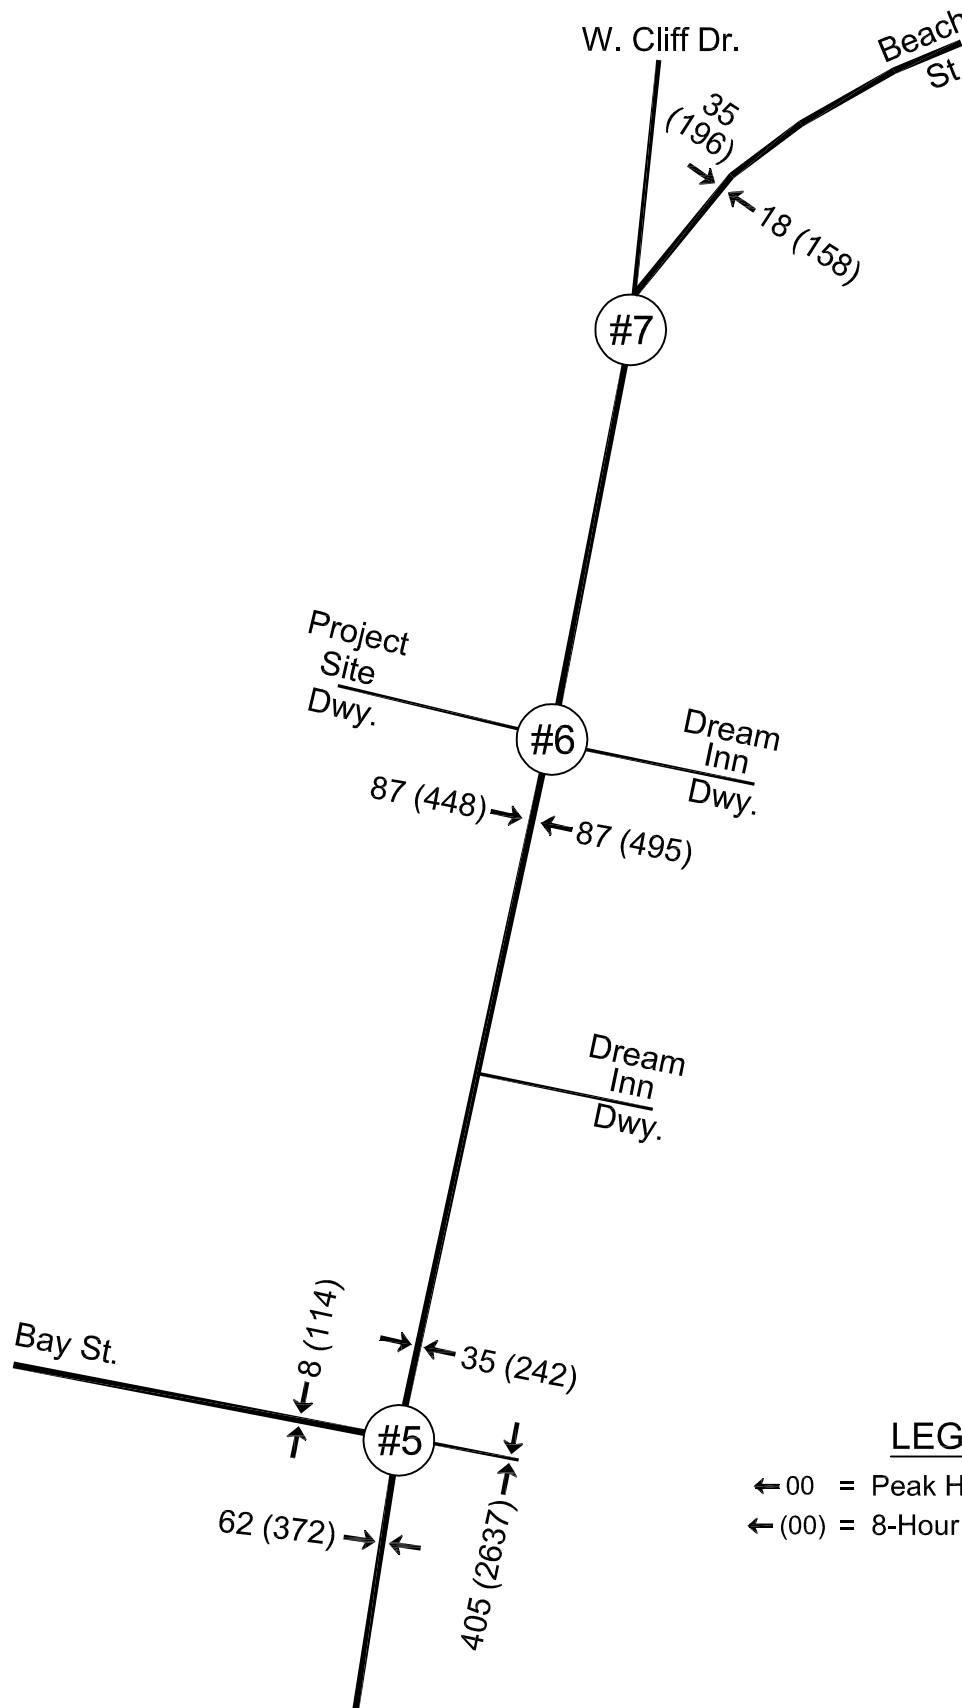

The TIA scope did not include an analysis of local bike facilities. The 2010 HCM does include methodologies for evaluating bike facilities (Bicycle LOS Score Model), which use physical parameters that need to be measured (e.g. lane widths, bike flow rates, bike speeds, delays at intersections, etc). The bicycle LOS score can be evaluated for roadway segments and intersections. The 2010 HCM suggest that the saturation flow rate (LOS E) for a 5-foot bike lane at a signalized intersection is approximately 2,000 bicycles per hour. The data on Figure 2D shows that the highest hourly flow in a Class II bike lane is 51 bicycles during the Saturday MD peak hour (southbound on W. Cliff Drive approaching Bay Street). The majority of bicycle traffic on the east side of W. Cliff Drive was recorded in the Class 4 Cycle Tracks. The hourly bike volumes currently using the Class II bike lanes on W. Cliff Drive and Bay Street are well below the capacity of a 5-foot bike lane.

The pedestrian volumes are displayed on Figure 2E. The data on Figure 2E indicates there was a significant amount of pedestrian activity near the project site, along the east side of W. Cliff Drive, and at the W. Cliff Drive / Bay Street intersection. The existing pedestrian volumes at the mid-block crosswalk (south of the Dream Inn driveway) exceed the minimum MUTCD “peak hour volume” signal warrant criteria (Warrant #4); >107 pedestrians per hour, pph). A review of the data also indicates pedestrian crossings also exceed the minimum “four-hour volumes” criteria. Based on information provided by City staff, alternatives to installing traffic signal control at the mid-block crosswalk (e.g. Rectangular Rapid Flashing Beacons, RRFB) will be implemented while the City monitors future conditions. Traffic signal control at the mid-block crosswalk could adversely impact operations at adjacent intersections, bike lanes and other crosswalks.

The TIA scope did not include an analysis of pedestrian facilities. The 2010 HCM does include methodologies for evaluating pedestrian facilities (Pedestrian LOS Score Model), which use physical parameters that need to be measured (e.g. facility characteristics, pedestrian spacing, pedestrian flow rate, walking speed, etc).

(April 2017)

(April 2017)

## Observations of Peak Period Operations (April 2017)

Traffic operations were observed during the weekday afternoon and Saturday mid-day peak periods to document existing traffic conditions. Saturday during the Easter weekend holiday was considered an ideal time to measure and observe traffic near the project site and typically represents a “design day” in the beach area.

During “peak” demand periods congestion was observed along Mission Street (SR 1). The congestion is related to the existing roadway segment capacity west of Chestnut Street and signal operations at the intersections. Vehicle queues along Mission Street (SR 1) were longer during the Saturday MD peak hour as compared to the weekday PM peak hour. During the weekday PM peak hour, large vehicle queues were observed on the eastbound approach of Bay Street at Mission Street (SR 1). During the “peak” demand period eastbound queues extended west of King Street. The data on Figures 2B and 2C shows that eastbound volumes on Bay Street at Mission Street (SR 1) were about 30% higher during the weekday PM peak hour than the Saturday MD peak hour.

Long vehicle queues were observed at the W. Cliff Drive / Bay Street intersection during peak demand periods (weekday PM and Saturday MD). Long southbound queues were also observed on Pacific Avenue at the Center Street roundabout during the Saturday MD peak hour. The eastbound queues on Bay Street at W. Cliff Drive and southbound queues on Pacific Street at Center Street are primarily related to traffic headed towards the boardwalk, Wharf and beach on a nice weather weekend day. During a short-period eastbound traffic on Beach Street (east of Pacific Avenue) was also backed up along the beach boardwalk. Observations during “non-peak” periods did not identify any significant operational issues at the study intersections.

## August 2017 Traffic Volumes and Intersection Level of Service

As discussed in the Introduction (Section 1.0), additional traffic count data was collected in August 2017 to represent summer traffic conditions during the summer tourism season. A comparison of the April 2017 and August 2017 roadway segment count data is provided in Table 3A. A summary of the comparison data and copies of the August 2017 roadway segment count data are included in Appendix A.

Table 3A - Existing Roadway Segment Traffic Volume Data Comparison

Roadway Segment	Period	April 2017	August 2017	Percent Change
W. Cliff Drive (north of Bay St.)	3-Day Avg. Saturday	18,363 ADT 17,614 ADT	17,779 ADT 17,329 ADT	-3.18% -1.62%
W. Cliff Drive (south of Bay St.)	3-Day Avg. Saturday	9,998 ADT 9,937 ADT	9,115 ADT 9,683 ADT	-8.83% -2.56%
Bay Street (west of W. Cliff Dr.)	3-Day Avg. Saturday	9,986 ADT 9,414 ADT	10,098 ADT 9,444 ADT	+1.12% +0.32%

The data in Table 3A demonstrates that average daily traffic (ADT) on W. Cliff Drive (north and south of Bay Street) was slightly less in August, as compared to the April count data. However, ADT on Bay Street (west of W. Cliff Drive) was slightly higher in August.

A comparison of the April and August peak hour traffic count data at the study intersections is summarized in Table 3B. The total peak hour intersection volumes are used for the comparison. A summary of the comparison data and copies of the August 2017 intersection traffic count data are included in Appendix A.

Table 3B - Existing Intersection Traffic Volume Data Comparison

Study Intersection	Period	April 2017	August 2017	Percent Change
Mission St. (SR 1) / Bay St.	Weekday PM Pk. Hr.	3,219	2,929	-9.01%
	Saturday MD Pk. Hr.	3,134	3,001	-4.24%
Bay St. / California St.	Weekday PM Pk. Hr.	1,180	961	-18.63%
	Saturday MD Pk. Hr.	1,103	964	-12.60%
Bay St. / California Ave.	Weekday PM Pk. Hr.	1,093	957	-12.44%
	Saturday MD Pk. Hr.	1,028	962	-6.42%
W. Cliff Dr. / Bay St.	Weekday PM Pk. Hr.	1,582	1,641	+3.73%
	Saturday MD Pk. Hr.	1,545	1,566	+1.36%
W. Cliff Dr. / Beach St.	Weekday PM Pk. Hr.	1,497	1,609	+7.48%
	Saturday MD Pk. Hr.	1,450	1,485	+2.41%
Pacific Ave. / Beach St.	Weekday PM Pk. Hr.	1,233	1,340	+8.68%
	Saturday MD Pk. Hr.	1,457	1,342	-7.89%
Pacific Ave. / Center St.	Weekday PM Pk. Hr.	1,467	1,506	+2.66%
	Saturday MD Pk. Hr.	1,747	1,636	-6.35%

The data in Table 3B demonstrates that total peak hour intersection volumes at the Mission Street (SR 1) / Bay Street, Bay Street / California Street, and Bay Street / California Avenue intersections were lower in August, as compared to the April count data. However, total peak hour intersection volumes at the remaining study intersections in the beach area were slightly higher in August during one or both study peak hour periods.

To evaluate the change in LOS associated with the higher August (summer) peak hour volumes at the W. Cliff Drive and Pacific Avenue study intersections, the LOS were re-evaluated using the higher weekday PM peak hour traffic demands. A summary of the comparison LOS data is provided in Table 4, with copies of the LOS worksheets included in the Appendix B.

Table 4 - Existing Intersection LOS Analysis Comparison

Study Intersection	Average Delay - LOS Value (a)	
	<u>April 2017</u> Weekday PM Pk. Hr.	<u>August 2017</u> Weekday PM Pk. Hr.
W. Cliff Dr. / Bay St. (All-Way Stop)	38.0 - E (b)	40.0 - E
W. Cliff Dr. / Beach St. (NBLT Stop Sign)	0.3 - A (9.8 - A)	0.4 - A (9.7 - A)
Pacific Ave. / Beach St. (Roundabout)	5.5 - A	6.3 - A
Pacific Ave. / Center St. (Roundabout)	7.9 - A	8.5 - A

(a) Highest stop sign controlled approach vehicle delay reported in parenthesis

(b) Existing LOS based on November 2018 traffic count data

The data in Table 4 demonstrates that the higher August (summer) weekday peak hour volumes at the W. Cliff Drive / Bay Street intersection also result in average delays within the LOS E range. The August PM peak hour volumes at the W. Cliff Drive / Bay Street intersection also exceed the minimum MUTCD signal warrant criteria. Delays at the remaining intersections are within the LOS A range, as documented under the LOS analysis using the April count data.

### August 2017 Bicycle and Pedestrian Traffic Volumes

The data collected on August 19<sup>th</sup> (Saturday) included bicycle and pedestrian traffic counts (10:00 AM - 6:00 PM). A review of the August bicycle count data indicates that volumes and patterns were fairly similar to those documented in April. However, the data shows that between 2:30 and 3:30 PM there were high directional bike volumes that made the eastbound left turn from Bay Street to northbound on W. Cliff Drive (328; 2:30-2:45 PM) and southbound through movement on W. Cliff Drive at Bay Street (282; 3:15-3:30 PM). During these 15-minute periods, the high bike volumes were also documented on Beach Street (eastbound). It is noted that there are several large annual athletic events in the City of Santa Cruz (e.g. Tri Santa Cruz held on August 12-13). In addition, there are local cycling clubs that frequently use the same routes as these annual events. Pedestrian traffic volumes and patterns were similar to the data collected in April. Copies of the August bicycle and pedestrian count data are included in Appendix A.

## 4.0 PROJECT CONDITIONS AND IMPACT ANALYSIS

The following is a description of the proposed project, an estimate of the project trip generation quantities, an assignment of the project trips to the local street system, and an evaluation of the potential project impacts on existing operations.

### Description

As previously stated, a private surface parking lot is currently located on the project site. The existing parking lot is used exclusively by the existing Dream Inn Hotel and Aquarius Restaurant located on east side of W. Cliff Drive. The proposed project will remove the existing parking lot and develop various residential and commercial uses with a subterranean parking structure. The proposed project includes:

- 89 Residential Condominiums (10 Affordable Units)
- 8,265 Square Foot (SF) of General Retail Space
- 7,525 SF of Restaurant / Food & Beverage
- 1,646 SF of Office Space
- 421 Parking Stalls on 3 Levels

The proposed office space will be used to accommodate administrative staff associated with the existing Dream Inn operations (east of W. Cliff Drive). It's anticipated that a portion of the general retail space could be used as a small "spa" for guests of the Dream Inn. Though the proposed office and spa area could be considered ancillary uses for the existing Dream Inn, the evaluation of potential project impacts considers these uses part of the proposed project to present a worst-case scenario.

The project driveway on W. Cliff Drive is proposed opposite the existing exit only driveway for the Dream Inn and Aquarius Restaurant. The project driveway on Bay Street will be located about 310' west of W. Cliff Drive. On-site parking will be provided for 421 vehicles. An evaluation of the proposed parking is provided in the Final Project Parking Analysis (Jan. 28, 2018).

### Project Trip Generation Estimates

The initial phase of the TIA included the preparation of a trip generation and parking analysis. The project trip generation estimates derived in the initial analysis were based on the data in the ITE Trip Generation Manual (9<sup>th</sup> Edition) and Handbook, and the City's General Plan (Appendix C - General Plan Traffic Analysis Methodologies). The City's "Townhome" trip rates were used to estimate the number of weekday (daily) and PM peak hour trips associated with the proposed residential component, as requested by the project applicant. The applicable ITE and City trip generation rates are presented in Table 5.

Table 5 - Applicable Trip Generation Rates

Land Use Category	Weekday Trip Generation Rates				
	AM Peak Hour		PM Peak Hour		Daily
	In	Out	In	Out	
ITE #230 - Residential Condo / TH (a)	0.07	0.37	0.55	0.27	8.11
ITE #710 - General Office (b)	1.37	0.19	0.25	1.24	11.03
ITE #826 - Specialty Retail (b)	0.00	0.00	1.19	1.52	44.32
ITE #931 - Quality Restaurant (b)	0.41	0.40	5.02	2.47	89.95
Land Use Category	Saturday Trip Generation Rates				
	Peak Hour of Generator			Daily	
	In	Out			
ITE #230 - Residential Condo / TH	0.25	0.22		5.67	
ITE #710 - General Office (b)	0.23	0.20		2.46	
ITE #826 - Specialty Retail (b & c)	2.81	2.21		42.04	
ITE #931 - Quality Restaurant (b)	6.38	4.44		94.36	

(a) Number of vehicle trips per unit (*PM peak hour and daily based on City rates*)

(b) Number of vehicle trips per 1,000 SF

(c) Weekday PM peak hour of generate rates

The total trips associated with a project are derived using the appropriate trip generation rates. A portion of the total trips associated with a mixed use development are trips between the uses, referred to as internal “captured” trips (trips that do not exit and re-enter the project site). The external project site trips are the total trips minus the internal captured trips. Therefore, the external trips are the trips that actually enter and exit the project site driveways. The external trips include “pass-by” and “diverted link” trips, and the single purpose “primary” trips. The pass-by and diverted link trips are the trips that come from the existing traffic already on the local street system and are expected to stop and use the commercial retail and restaurant uses. The single purpose primary trips are the actual number of new trips generated by the proposed project uses. Therefore, the evaluation of the potential project impacts is based on the number of new single purpose primary trips.

The ITE mixed-use development spreadsheet (NCHRP 684 Internal Trip Capture Estimating Tool) was used to estimate the amount of internal captured trips associated with the proposed project and existing uses (trips that do not exit and re-enter the site). Though the Dream Inn and Aquarius Restaurant are located on the east side of W. Cliff Drive, the parking associated with these existing uses will continue to be provided on the project site. The ITE mixed-use development spreadsheet indicates that during an average weekday PM peak hour approximately 10% of the non-residential trips (retail, restaurant and office) would be internal captured trips (e.g. portion of trips generated by a mixed-use development that both begin and end with the development, as in the case of a resident or hotel guest shopping at the retail facilities or eating at a restaurant). The spreadsheet also demonstrates that if the residential component trips are included in the calculations about 17%

of the total trips would be internal captured trips. Copies of the ITE mixed-use development spreadsheets is included in Appendix D. Based on consultation with City staff, a 10% internal captured trip reduction was applied to the total project trip generation estimates. Therefore, 90% of the total project trips will be external trips.

Data in the ITE Trip Generation Manual indicates that a significant portion (70-75%) of retail related trips will be pass-by and/or diverted-link type trips coming from traffic already on the local street system. Based on consultation with City staff, a 10% pass-by trip reduction was only applied to the project retail and restaurant trips. The new single purpose primary trips are the external trips (90% of the total trips) minus the pass-by trips associated with the retail and restaurant uses. The weekday trip generation estimates associated with the proposed uses are presented in Table 6A.

Table 6A - Project Trip Generation Estimates (Weekday)

Project Component	Number of Weekday Vehicle Trips				
	AM Peak Hour		PM Peak Hour		Daily
	In	Out	In	Out	
Residential Condos / Townhomes - 89 Units	6	33	49	24	722
Commercial Retail - 8,265 SF	0	0	10	13	366
Dining - 7,525 SF	3	3	38	19	676
Office - 1,646 SF	2	0	0	2	18
Total Project Trips:	11	36	97	58	1,782
Internal Captured Trips (10%):	-1	-4	-10	-6	-178
Project External Trips (90%):	10	32	87	52	1,604
Pass-By Trips (10%):	0	0	-5	-3	-104
Project New "Primary" Trips:	10	32	82	49	1,500

The proposed project uses will generate a total of approximately 1,782 weekday trips (two-way trip ends); with 1,500 new primary daily trips. The proposed uses will also generate approximately 42 new primary trips during the AM peak hour (10 inbound & 32 outbound) and 131 new primary trips during the PM peak hour (82 inbound & 49 outbound).

The Saturday trip generation estimates associated with the proposed project uses are presented in Table 6B. The proposed uses will generate a total of approximately 1,566 trips on a Saturday (two-way trip ends); with 1,304 new primary daily trips. The proposed uses will also generate approximately 137 new primary trips during the MD peak hour on a typical Saturday (78 inbound & 59 outbound).

Table 6B - Project Trip Generation Estimates (Saturday)

Project Component	Number of Vehicle Trips		
	Peak Hour of Generator		Daily
	In	Out	
Residential Condos / Townhomes - 89 Units	22	20	504
Commercial Retail - 8,265 SF	23	18	348
Dining - 7,525 SF	48	33	710
Office - 1,646 SF	1	0	4
<b>Total Project Trips:</b>	<b>94</b>	<b>71</b>	<b>1,566</b>
Internal Captured Trips (10%):	-9	-7	-156
Project External Trips (90%):	85	64	1,410
Pass-By Trips (10%):	-7	-5	-106
<b>Project New “Primary” Trips:</b>	<b>78</b>	<b>59</b>	<b>1,304</b>

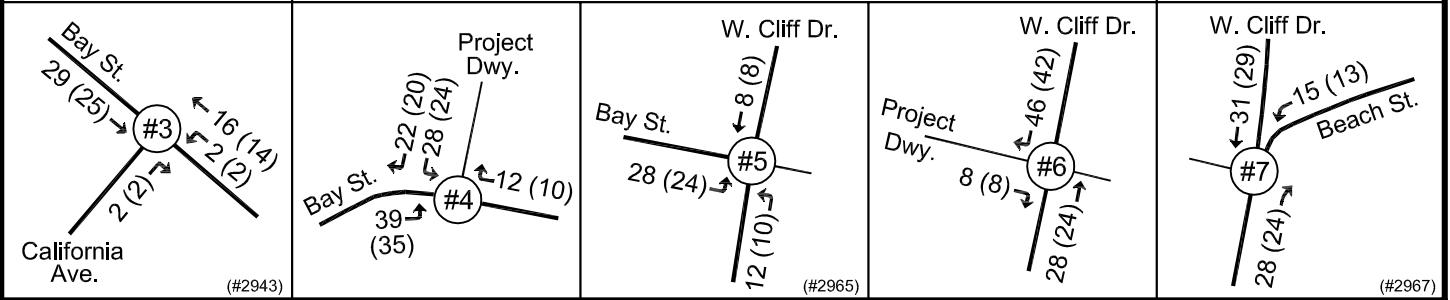

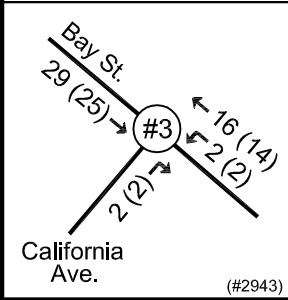

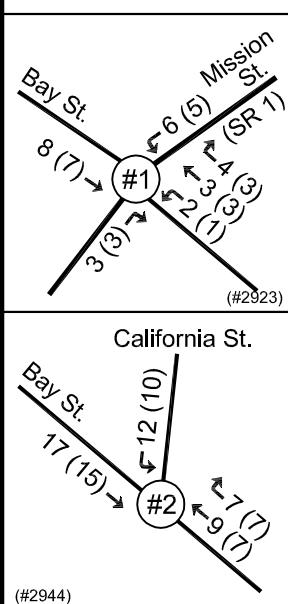

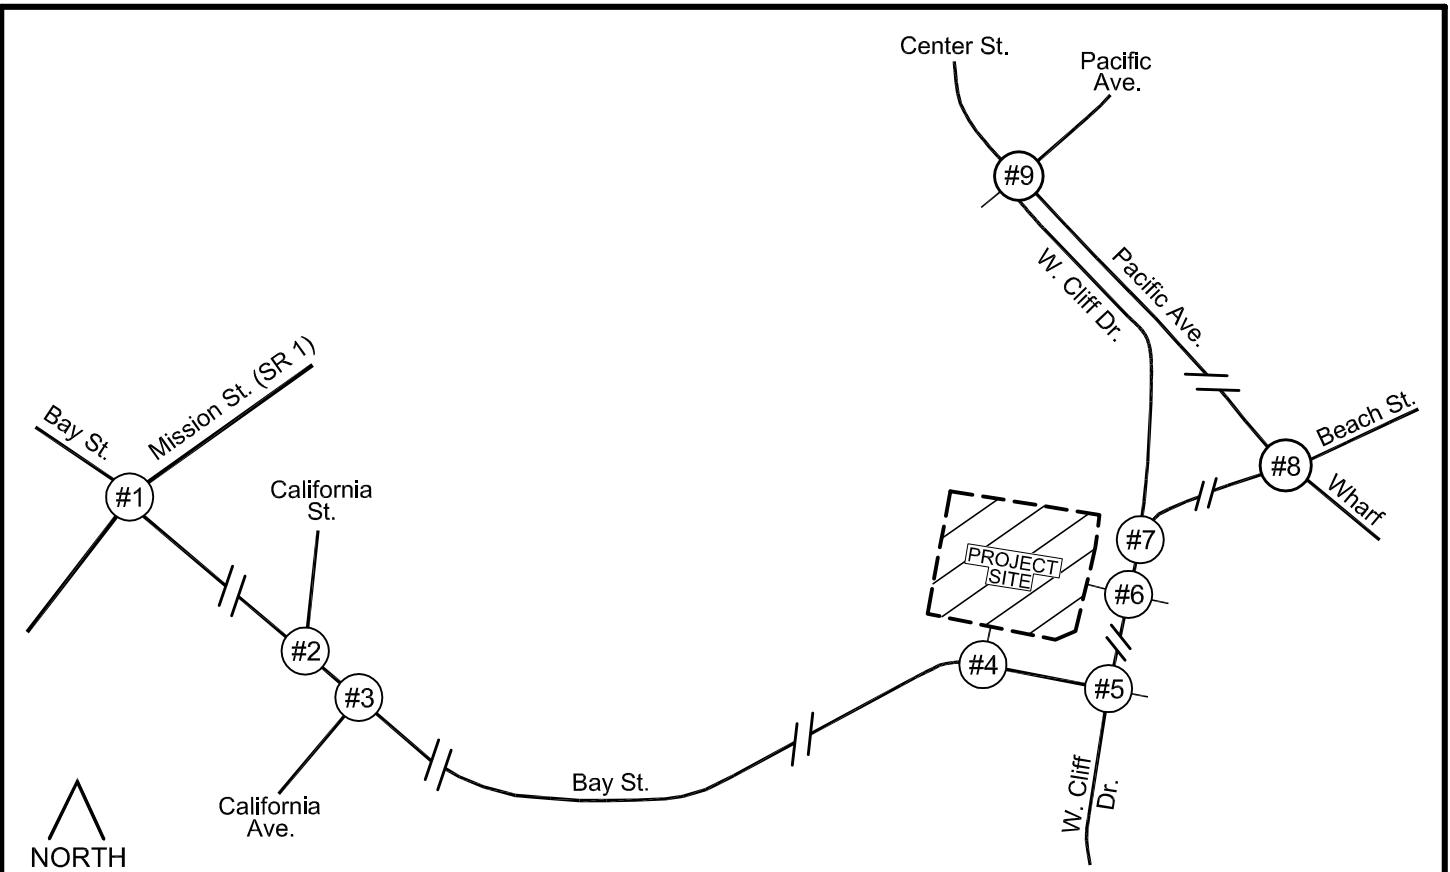

### Project Access and Traffic Assignment

Project access will be provided via driveways on W. Cliff Drive and Bay Street. The W. Cliff Drive driveway (opposite the existing Dream Inn driveway) will provide right-turn only ingress and egress to the project site. The Bay Street driveway will provide full (left and right turns) ingress and egress for the residences and commercial uses.

The assignment of project trips to the local street system was based on a review of local travel patterns and data in the City's General Plan (Appendix F-5). The area wide project trip distribution percentages were developed in consultation with City staff. Exhibits illustrating the area wide trip distribution percentages for the residential, office, retail and restaurant uses are included in Appendix D (Exhibits 1A and 1B). The total and external project trips (previous uses) for the weekday PM peak hour are illustrated on Figure 3A, and the primary (new single purpose) and pass-by trips are shown on Figure 3B. The Saturday MD peak hour project trips are illustrated on Figures 4A (total and external) and 4B (primary and pass-by).

The existing valet service for the Dream Inn and Aquarius Restaurant use the existing driveways on W. Cliff Drive (1 inbound only and 1 outbound only). When a hotel or restaurant customer enters the southerly driveway on the east side of W. Cliff Drive (entrance only), the valet staff takes the vehicle across W. Cliff Drive and parks it in the designated valet parking area (on the project site). The valet staff walks back across W. Cliff Drive to the valet desk. Currently when a customer wishes to pick up their vehicle, the valet staff walks across W. Cliff Drive and gets the vehicle and exits the W. Cliff Drive driveway. The valet staff turns right and goes south on W. Cliff Drive and turn left across northbound traffic to enter the southerly entrance only driveway.

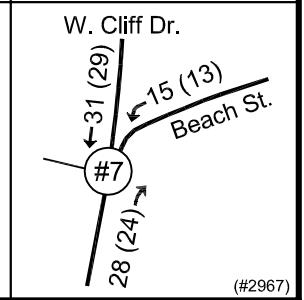

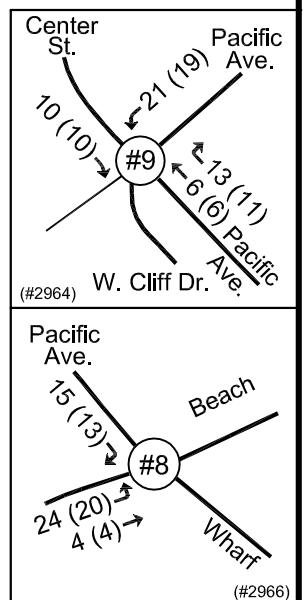

Parking for the valet service will be provided on Level P2. All Dream Inn and Aquarius Restaurant guest vehicles will be valet parked upon development of the project (24 hours a day, 7 days a

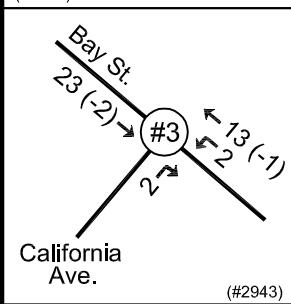

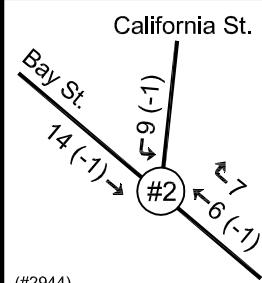

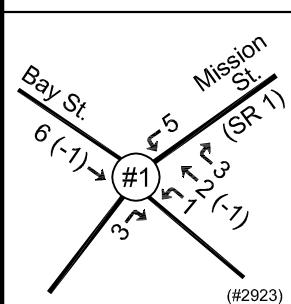

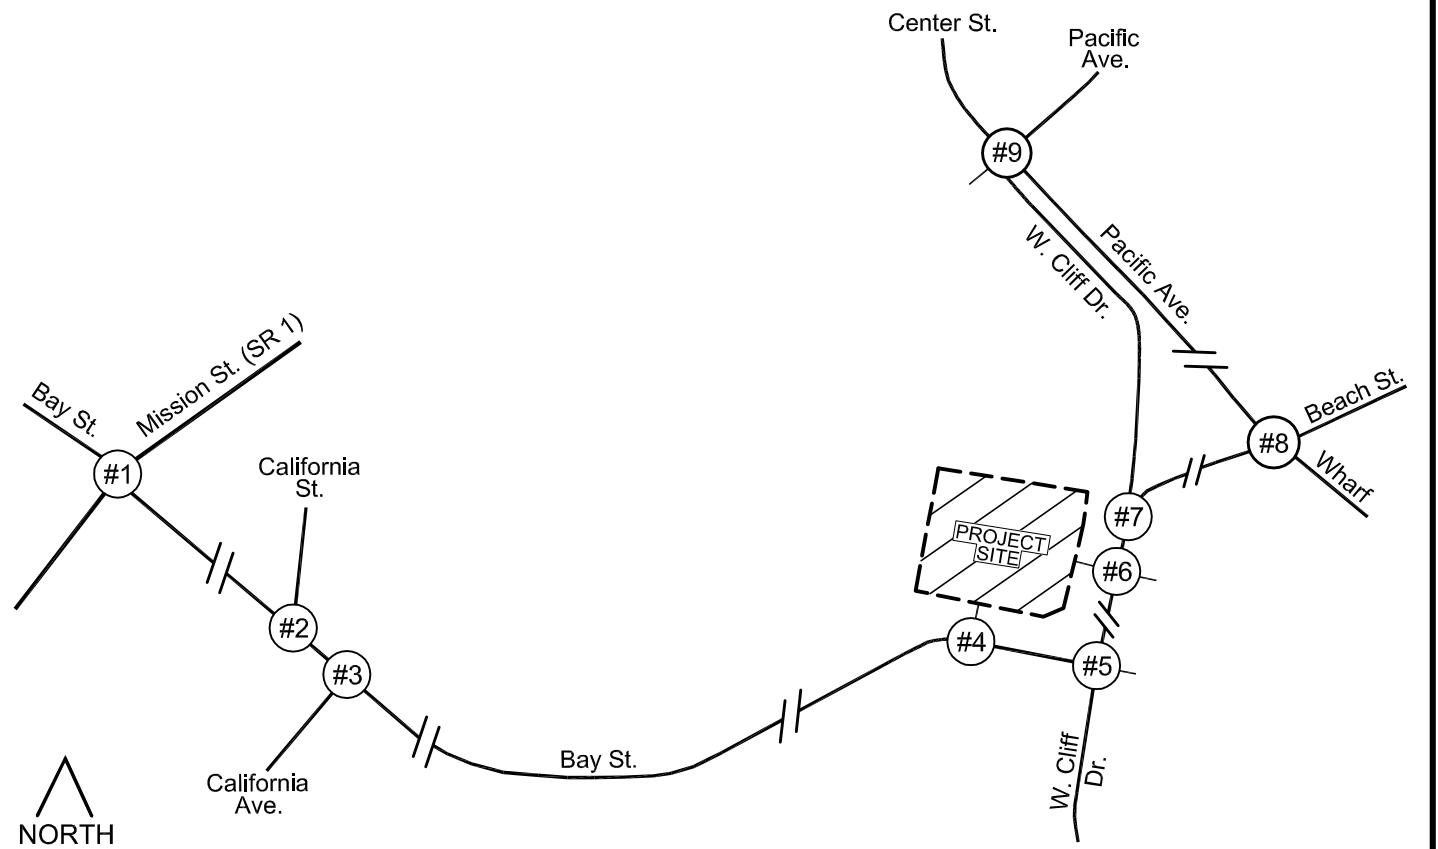

**LEGEND**

week). When a guest/customer drops off a vehicle at the valet desk in front of the Dream Inn the valet staff will exit the driveway on W. Cliff Drive (turn right) and proceed north to the Pacific Avenue / Beach Street (roundabout) intersection. The vehicle will then be driven around the roundabout and proceed back south on Beach Street and W. Cliff Drive and turn right in the project driveway. The vehicle will be parked on Level P2. The valet staff will walk back across W. Cliff Drive to the valet desk. When a guest/customer wishes to pick up their vehicle, valet staff will walk across W. Cliff Drive and go to Level P2 to retrieve the vehicle. The vehicle will then be driven up ramp and go left around the back side of the project structure and then turn left exiting the Bay Street driveway and proceed east to the W. Cliff Drive / Bay Street intersection. The vehicle will then turn left and proceed north on W. Cliff Drive and make a right turn in the southerly Dream Inn driveway. This will eliminate the valet service “return” traffic from using the W. Cliff Drive driveway and needing to turn left across northbound traffic to enter the southerly Dream Inn entrance only driveway. This will also reduce the potential vehicular-pedestrian conflicts at the mid-block crosswalk on W. Cliff Drive (south of the driveway). The existing valet service trips were modified using the new circulation patterns.

### **City of Santa Cruz Planned Improvements**

The City’s adopted Capital Investment Program (CIP) is a multi-year schedule of projects with their associated costs and proposed funding sources. The CIP represents the best efforts to allocate available and projected resources toward projects that provide the most benefit for the people of Santa Cruz.

In 2018, the City of Santa Cruz approved a new CIP for fiscal years 2019-2021 (CIP), which identified needed improvements at the W. Cliff Drive / Bay Street intersection (either as a potential traffic signal or roundabout) along with a funding mechanism for their implementation, consistent with the City’s General Plan 2030. The CIP indicates this intersection would be primarily funded through the City’s Transportation Impact Fee (TIF) program and future transportation grants.

The RRFB to be installed at the mid-block crosswalk on W. Cliff Drive (south of the Dream Inn driveway) is funded by an HSIP Cycle 8 Grant in the City’s adopted CIP and construction is anticipated in 2019.

### **Project Improvement Variants**

As requested by City staff, the project applicant has agreed to incorporate new improvements at the W. Cliff Drive / Bay Street intersection. The new improvements would be constructed as part of the project to be completed prior to occupancy. Therefore, the following analysis assumes a “baseline” that would include either a new traffic signal or a mini-roundabout at W. Cliff Drive / Bay Street intersection (e.g. a baseline that more accurately reflects conditions as they will exist on the date the project opens).

The existing conditions traffic signal warrant analysis documented that traffic volumes during the weekday PM and Saturday MD peak hours at the W. Cliff Drive / Bay Street intersection currently

exceed the minimum MUTCD criteria. As previously indicated, the City's TIF Program and CIP include the installation of traffic signal control or a roundabout at this intersection. Therefore, the project applicant has included two (2) project variants for the City's consideration as part of the overall project. The traffic analysis includes a comparative evaluation of signal control versus a mini-roundabout at the W. Cliff Drive / Bay Street intersection. Each project improvement variant, as well as its potential impacts on key intersections is discussed and evaluated.

### **City of Santa Cruz Level of Significance Criteria**

The evaluation of potential project impacts is based on applicable "level of significance" criteria defined in City Plans, policies, and/or guidelines; and in accordance with CEQA. As previously discussed, the City's LOS "D" standard is used to evaluate conditions at the study intersections and the Caltrans LOS "C/D" transition target is also referenced for the Mission Street (SR 1) / Bay Street intersection. A potentially significant impact would occur when:

- Project would conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system
- Project would substantially increase hazards due to a design feature
- Project traffic would cause intersection operations to degrade from an acceptable LOS to an unacceptable level (LOS E or F)
- Project traffic would result in LOS below the LOS "D" or where a project would contribute traffic of more than 3% at an intersection currently operating at an unacceptable level (applicable only to the existing plus project scenario). The City's General Plan policies consider accepting a LOS below the LOS "D" at major regional intersections where improvements would be prohibitively costly or results in significant, unacceptable environmental impacts (e.g. at the Mission Street (SR 1) / Bay Street intersection).
- City intersections that already operate at an unacceptable level (LOS E or F), the City considers project impacts to be significant if congestion will measurably worsen with the addition of project traffic (increase of 3%)

### **Intersection Level of Service Analysis (April 2017)**

The following LOS analysis evaluates the potential project impacts associated with the two (2) project improvement variants against existing conditions based on the City's Level of Significance Criteria.

#### **Variant No. 1: Existing Plus Project Conditions (Signal Variant Plus RRFB)**

The first project improvement variant includes the components listed below which were based on a review of the existing traffic data (vehicular, bicycle and pedestrian) and the existing conditions analysis, and the references in the City's CIP regarding the option of installing a signal control at the W. Cliff Drive / Bay Street intersection.

- Install a Traffic Signal at W. Cliff Drive / Bay Street Intersection
- Maintain Stop Sign Control for the Project Site Driveway on W. Cliff Drive (Right Turns Only, In & Out)
- Maintain Stop Sign Control for the Dream Inn Driveway on W. Cliff Drive (Right Turns Only, In & Out)
- Widen the Existing Mid-Block Crosswalk Pedestrian Refuge Island and Maintain RRFB
- Widen the Sidewalk on East Side of W. Cliff Drive (north of Project Driveway)
- Install “GREEN” Bike Lane Treatment Striping
- Install Left Turn Lane on Bay Street at the Project Driveway

The median refuge area will be a minimum width of 6 feet to meet United States Access Board’s accessibility requirements. The median refuge island would create a 2 stage pedestrian crossing on W. Cliff Drive, if feasible (pedestrians could cross one direction of travel at a time). This could also create a small deflection in the crosswalk alignment and provide a perpendicular crosswalk on both sides of W. Cliff Drive. The analysis of project improvement Variant No. 1 has been conducted for the following scenarios:

- Existing Plus Project Weekday PM Peak Hour
- Existing Plus Project Saturday MD Peak Hour
- Total Cumulative (General Plan) Weekday PM Peak Hour (includes project traffic)

The improvement modifications associated with Variant No. 1 will mainly affect the analysis of the study intersections along W. Cliff Drive. An analysis of the project driveway on Bay Street includes an exclusive left turn lane on the eastbound approach.

The existing traffic volumes (Figures 2B and 2C) were adjusted to reflect the left turn restrictions (right turns only, in and out) at the driveways on W. Cliff Drive (Dream Inn and project site) and the modified valet service circulation. The adjusted existing volumes also reflect a left turn restriction on W. Cliff Drive for the Dream Inn driveway just north of Bay Street (ingress only). Copies of the existing plus project traffic volumes for Variant No. 1 are included in Appendix D (Exhibit 2A - Weekday PM peak hour and Exhibit 3A - Saturday MD peak hour).

The existing plus project volumes associated with Variant No. 1 were again evaluated using the Synchro 9 and HCS7 software. The results of the existing plus project intersection LOS analysis are presented in Table 7A. Copies of the LOS worksheets are included in Appendix B.

Table 7A - Existing Plus Project Intersection LOS Analysis (Variant No. 1)

Study Intersection	Peak Hour	Vehicle Delay - LOS Value (a)	
		Existing	Existing Plus Project
Mission St. (SR 1) / Bay St.	Weekday PM	36.7 - D	37.8 - D

	Saturday MD	10.8 - B	10.9 - B

(a) Highest stop sign controlled approach delay reported in parenthesis

(b) Existing plus project conditions analyzed with project improvements

The data in Table 7A indicates that average vehicle delays at the study intersections will remain within acceptable limits (LOS D or better). Therefore, it's concluded that the project will not significantly impact existing peak hour operations based on the City's level of significance criteria. It's noted that the project traffic will comprise less than 3% of the existing plus project weekday PM peak hour traffic volumes at the W. Cliff Drive / Bay Street intersection. A copy of the project percent contribution spreadsheet is included in Appendix D. The installation of signal control at the W. Cliff Drive / Bay Street intersection will reduce average delays as compared to the existing "all-way" stop control by approximately 58% (weekday PM peak hour) and 46% (Saturday MD peak hour). The 95<sup>th</sup> percentile queues will not exceed 1-2 vehicles on the southbound approach of the Bay Street driveway or in the eastbound left turn lane on Bay Street.

Delays on California Street (southbound left turn) at Bay Street will continue in the LOS E range (during one or both peak hours). The installation of "all-way" stop sign control at Bay Street / California Street intersection would provide average delays in the LOS C-D range. However, as discussed under existing conditions the LOS analysis software may over-estimates the delays on the California Street and not accurately reflect the gaps in east-west traffic on Bay Street created by the "all-way" stop control at California Avenue. The installation of all-way stop sign control

at the Bay Street / California Street intersection may also conflict with operations at the Bay Street / California Avenue intersection (all-way stop control). Therefore, the installation of “all-way” stop control at the Bay Street / California Street intersection is not recommended for the existing plus project scenario. The project traffic will comprise less than 3% of the existing plus project traffic volumes at the Bay Street / California Street intersection and the existing plus project traffic volumes will not exceed the minimum “peak hour” signal warrant criteria (weekday PM and Saturday MD peak hours). Therefore, it’s concluded that the project traffic will not significantly impact peak hour operations at the Bay Street / California Street intersection.

### **Variant No. 2: Existing Plus Project Conditions (Mini-Roundabout Variant Plus RRFB)**

At the direction of City staff, Pinnacle Traffic Engineering and MSA (Ourston) developed a series of mini-roundabout concepts for the Bay Street / W. Cliff Drive intersection. The latest mini-roundabout concept, which was evaluated in the MSA (Ourston) memoranda (August 27, 2018 and September 27, 2018) addressed some of the geometric design challenges associated with the initial concept (e.g. maintains 2 southbound approach lanes on W. Cliff Drive at Bay Street). The mini-roundabout alternative includes the components listed below.

- Install a Mini-Roundabout at W. Cliff Drive / Bay Street Intersection
- Maintain Two (2) Southbound Lanes on W. Cliff Drive at Bay Street
- Maintain Stop Sign Control for the Project Driveway on W. Cliff Drive  
(Right Turns Only, In & Out)
- Maintain Stop Sign Control for the Dream Inn Driveway on W. Cliff Drive  
(Right Turns Only, In & Out)
- Widen the Existing Mid-Block Crosswalk Pedestrian Refuge Island and Maintain RRFB
- Widen the Sidewalk on East Side of W. Cliff Drive (north of Project Driveway)
- Install “GREEN” Bike Lane Treatment Striping
- Install Left Turn on Bay Street at the Project Driveway

Similar to the analysis for Variant No. 1, the analysis of Variant No. 2 has been conducted for the following scenarios:

- Existing Plus Project Weekday PM Peak Hour
- Existing Plus Project Saturday MD Peak Hour
- Total Cumulative (General Plan) Weekday PM Peak Hour (includes project traffic)

The evaluation of operations associated with Variant No. 2 was also conducted with the modified existing traffic volumes as described under Variant No. 1. Copies of the existing plus project volumes for Variant No. 2 are included in Appendix D (Exhibit 2B - Weekday PM peak hour and Exhibit 3B - Saturday MD peak hour). The existing plus project volumes associated with Variant No. 2 were again evaluated using the Synchro 9 and HCS7 software. The results of the existing plus project intersection LOS analysis are presented in Table 7B. Copies of the LOS worksheets are included in Appendix B.

Table 7B - Existing Plus Project Intersection LOS Analysis (Variant No. 2)

Study Intersection	Peak Hour	Vehicle Delay - LOS Value (a)	
		Existing	Existing Plus Project
Mission St. (SR 1) / Bay St.	Weekday PM	36.7 - D	37.8 - D
	Saturday MD	29.6 - C	30.6 - C
Bay St. / California St.	Weekday PM	8.7 - A (36.6 - E)	10.4 - B (43.9 - E)
	Saturday MD	9.9 - A (34.2 - D)	11.3 - A (39.7 - E)
Bay St. / California Ave.	Weekday PM	15.5 - C	16.5 - C
	Saturday MD	14.7 - B	15.6 - C
W. Cliff Dr. / Bay St. (b)	Weekday PM	38.0 - E	8.2 - A
	Saturday MD	24.2 - C	7.4 - A
W. Cliff Dr. / Beach St.	Weekday PM	0.3 - A (9.8 - A)	0.3 - A (10.0 - A)
	Saturday MD	0.4 - A (10.1 - B)	0.3 - A (10.4 - B)
Pacific Ave. / Beach St.	Weekday PM	5.5 - A	5.7 - A

	Saturday MD	10.8 - B	11.1 - B

(a) Highest stop sign controlled approach delay reported in parenthesis

(b) Existing plus project conditions analyzed with project improvements

The data in Table 7B indicates that average delays will remain within acceptable limits (LOS D or better). Therefore, it is concluded that the project will not significantly impact existing peak hour operations based on the City's level of significance criteria. It's noted that the project traffic will comprise less than 3% of the existing plus project weekday PM peak hour traffic volumes at the W. Cliff Drive / Bay Street intersection. A copy of the project percent contribution spreadsheet for the mini-roundabout at the W. Cliff Drive / Bay Street intersection is included in Appendix D. The 95<sup>th</sup> percentile queues will not exceed 1-2 vehicles on the southbound approach of the Bay Street driveway or in the eastbound left turn lane on Bay Street.

Delays on California Street (southbound left turn) at Bay Street will continue in the LOS E range (during one or both peak hour periods), as discussed under Variant No. 1. However, the existing plus project traffic volumes at the Bay Street / California Street intersection will not exceed the minimum "peak hour" signal warrant criteria. The installation of all-way stop sign control at the Bay Street / California Street intersection may also conflict with operations at the Bay Street / California Avenue intersection (all-way stop control). Therefore, the installation of "all-way" stop control at the Bay Street / California Street intersection is not recommended for the existing plus project scenario.

The project traffic will comprise slightly more than 3% of the existing plus project traffic volumes at the Bay Street / California Street intersection under Variant No. 2 (weekday PM peak hour only). However, the analysis does not take into consideration the potential trip reductions associated with implementing the project's Transportation Demand Management (TDM) Program. A reduction in the project's weekday PM peak hour trips of approximately 5% would lower the project's percentage to less than 3% percent of the total existing plus project traffic volumes. A reduction of this magnitude is slightly lower than documented in the project's TDM Program (5.8-7.8%). Therefore, it's concluded that the project traffic will not significantly impact peak hour operations at the Bay Street / California Street intersection.

## 5.0 CUMULATIVE CONDITIONS

The project TIA scope includes an evaluation of cumulative traffic conditions. The cumulative traffic volume projections reflect the future forecast growth documented in the City's General Plan 2030 Environmental Impact Report (EIR). The General Plan 2030 buildout scenario used for the cumulative analysis includes the long-range growth anticipated for UCSC. The following is a description of the General Plan 2030 traffic volume forecast projections and an evaluation of the project impacts associated with the two (2) improvement variants.

### Cumulative (General Plan 2030) Traffic Volumes

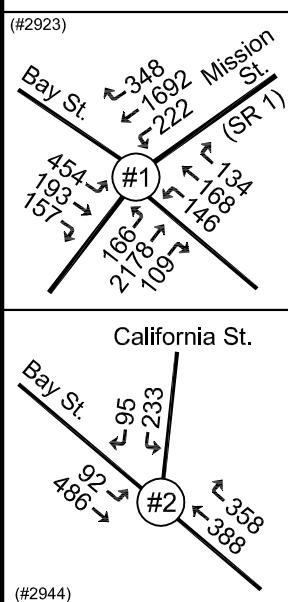

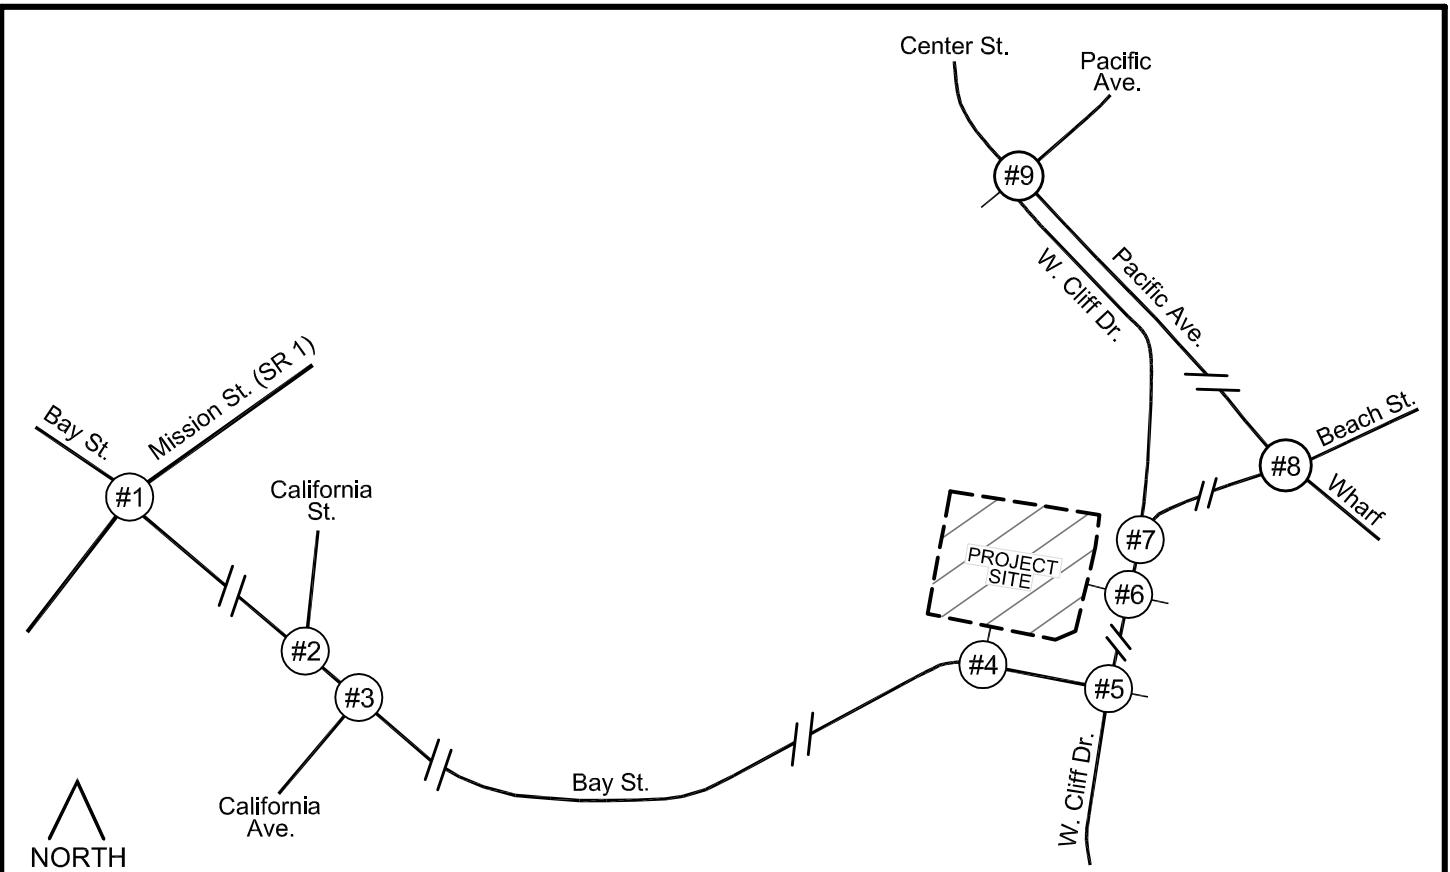

The General Plan 2030 buildout traffic projections were developed in 2010 (weekday PM peak hour). Discussions with City staff indicated that the General Plan 2030 buildout traffic projections did not include any vehicle trips associated with the development of the project site. Therefore, the project "primary" trips (weekday PM peak hour volumes on Figure 3B) were added to the base-line volumes for the General Plan 2030 buildout scenario. The Total Cumulative Traffic Volumes reflective of the General Plan 2030 buildout conditions plus the project are illustrated on Figures 5A (Variant No.1) and 5B (Variant No. 2).

### Planned Transportation Improvements

The City of Santa Cruz and Santa Cruz County Regional Transportation Commission (SCCRTC) Regional Transportation Plan have identified the improvements to the transportation system to address future deficiencies and accommodate long range growth. These improvements are generally funded through the City's TIF Program, gas tax funds and transportation grants, and commonly programmed as part of the City's CIP. The City's TIF Program and CIP include future improvements at the following study intersections:

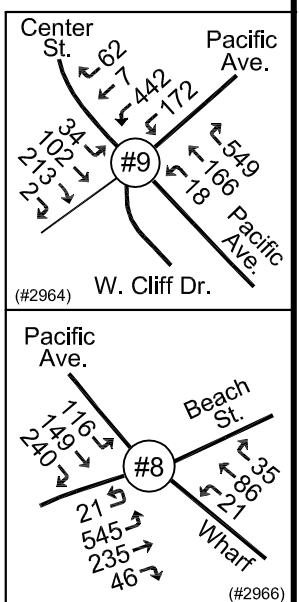

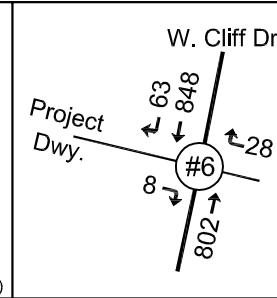

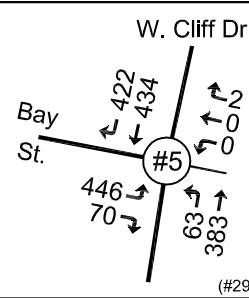

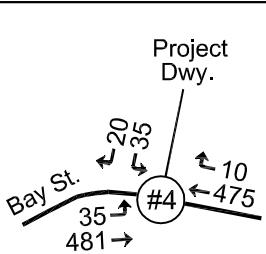

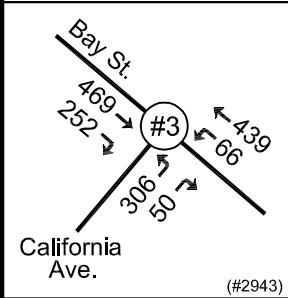

Mission Street (SR 1) / Bay Street  
Bay Street / California Street  
Bay Street / California Avenue  
W. Cliff Drive / Bay Street

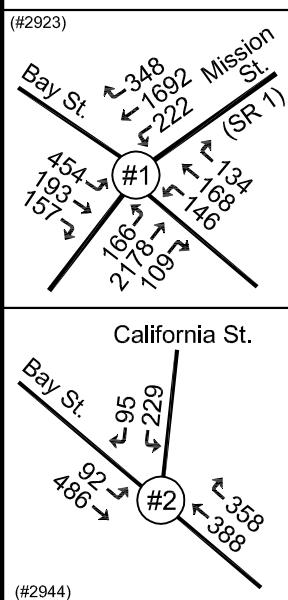

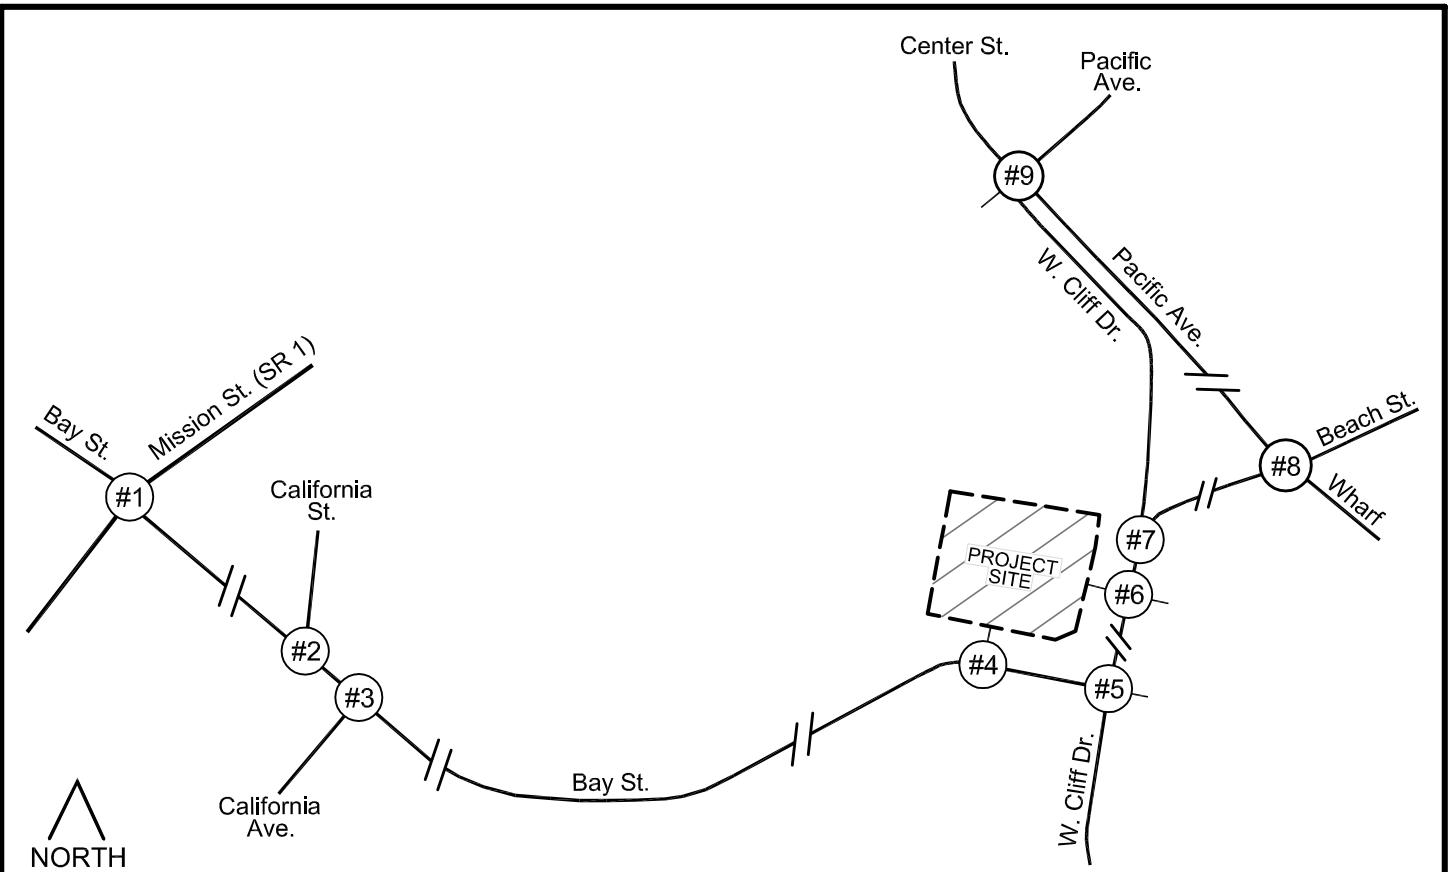

Future improvements at the Mission Street (SR 1) / Bay Street intersection identified in the City's General Plan 2030 EIR include adding an exclusive right turn lane on both Mission Street (SR 1) approaches, adding a second left turn lane and an exclusive right turn lane on the eastbound approach of Bay Street; and adding a right turn lane on the westbound approach of Bay Street (also converting the existing shared through-right lane to a through lane). The future improvements at the California Street and California Avenue intersections are not clearly stated in the General Plan 2030 EIR but will likely include traffic signal control. The traffic volumes indicates that peak hour demands will exceed the minimum MUTCD signal warrant criteria. Therefore, it was deemed reasonable to analyze these intersections using traffic signal control. The traffic signal control at the California Street and California Avenue intersections would be interconnected and

LEGEND  
← 00 = PM Peak Hour Volume

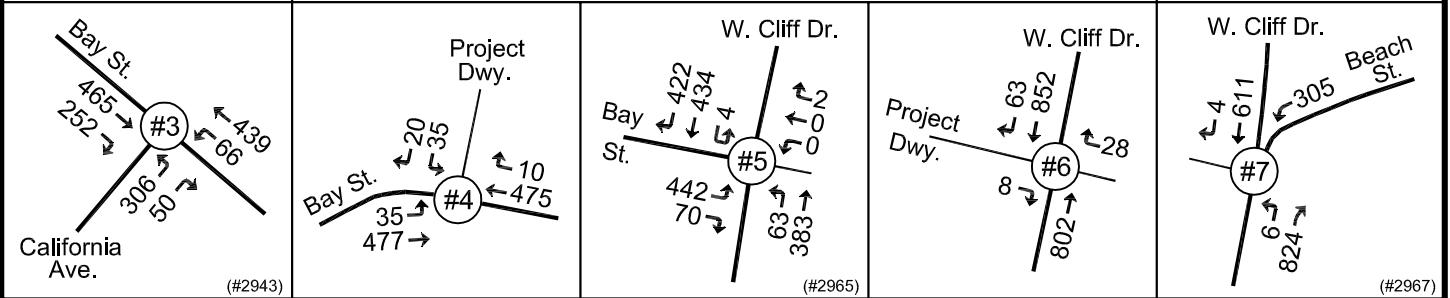

### - Improvement Variant No. 1 - (Signal at Bay St. / W. Cliff Dr.)

LEGEND  
← 00 = PM Peak Hour Volume

### - Improvement Variant No. 2 - (Mini-Roundabout at Bay St. / W. Cliff Dr.)

synchronized. The installation of traffic signal control at these intersections may necessitate additional improvements (e.g. left turn lanes on Bay Street). However, the cumulative analysis was conducted assuming the existing lane configurations. As previously described, the installation of a traffic signal or a mini-roundabout at the W. Cliff Drive / Bay Street intersection is proposed as part of the project (Variant No. 1 and No. 2).

### Level of Service Analysis

Similar to the exercise performed for the existing plus project scenario (Variants No. 1 and 2), the project and cumulative volumes reflect the egress (outbound) left turn restrictions on W. Cliff Drive and modified valet service circulation. The total cumulative traffic volumes associated with project improvement Variant No. 1 and No. 2 were evaluated using the Synchro 9 and HCS7 software. The results of the cumulative (General Plan 2030) intersection LOS analysis are presented in Table 8. The existing LOS analysis data is also provided in Table 8 for comparison purposes. Copies of the LOS worksheets are included in Appendix B.

Table 8 - Total Cumulative (General Plan 2030) Intersection LOS Analysis

Study Intersection	Vehicle Delay - LOS Value (a)		
	Existing	Total Cumulative (a)	
		Variant No. 1	Variant No. 2
Mission St. (SR 1) / Bay St.	36.7 - D	>80 - F	>80 - F
Bay St. / California St. (b)	8.7 - A (36.6 - E)	20.8 - C	20.8 - C
Bay St. / California Ave. (b)	15.5 - C	14.0 - B	14.0 - B
W. Cliff Dr. / Bay St.	38.0 - E	19.0 - B	9.5 - A
W. Cliff Dr. / Beach St.	0.3 - A (9.8 - A)	0.3 - A (10.3 - A)	0.3 - A (10.3 - B)
Pacific Ave. / Beach St.	5.5 - A	6.5 - A	6.5 - A
Pacific Ave. / Center St.	7.9 - A	10.4 - B	10.5 - B

(a) Highest stop sign controlled approach delay reported in parenthesis

(b) Analysis with project traffic signal improvements

The data in Table 8 indicates that average delays at the study intersections will be within acceptable limits (LOS D or better) under each total cumulative scenario, except at the Mission Street (SR 1) / Bay Street intersection. The Mission Street (SR 1) / Bay Street intersection will experience delays in the LOS F range. The City's General Plan 2030 EIR acknowledges that future LOS at this intersection will remain at unacceptable levels, and therefore, the General Plan includes a policy that considers a lower LOS is acceptable at major regional intersections. A copy of the project percent contribution spreadsheets are included in Appendix D.

As previously stated, improvements associated with Variant No. 1 (signal alternative) and Variant No. 2 (mini-roundabout alternative) will modify the existing and cumulative base-line traffic volumes due to the various turning movement restrictions along W. Cliff Drive. The modified base-line volumes will increase existing and future demands at the W. Cliff Drive / Bay Street intersection. The turn movement restrictions will also increase the project traffic demands at this intersection. The project trips will comprise less than 3% of the “total cumulative (GP 2030)” weekday PM peak hour traffic volumes at the W. Cliff Drive / Bay Street intersection. The project trips also comprised less than 1% of the total cumulative (GP 2030) weekday PM peak hour traffic volumes at the Mission Street (SR 1) / Bay Street intersection.

Payment of the City’s TIF helps offset any potential long-term impacts related to local development projects. Therefore, payment of the TIF serves as the project’s “fair-share” contribution towards the funding of future infrastructure improvements necessary to maintain and/or achieve acceptable traffic operations.

### **Supplemental Microsimulation Modeling**

City staff requested that the project applicant retain an expert to develop microsimulation models for the two (2) proposed intersection control alternatives (Variant No. 1 and No. 2). The additional analyses was conducted by MSA (Ourston) and the main purpose was to enhance the Project TIA’s otherwise “static” operational analyses with visualization of several alternatives for comparison. In order to account for the vehicular, pedestrian and bicycle traffic interactions the alternatives were modeled using the VISSIM microsimulation software. The VISSIM modeling and operational analysis was performed using the cumulative turning movement forecasts developed for the Saturday MD peak hour.

### **VISSIM Simulation Qualitative Analysis**

Both alternatives (Variant No. 1 and Variant No. 2) were analyzed using the VISSIM 9.00-13 microsimulation software for the Saturday MD peak hour, which includes anticipated increases in vehicular, pedestrian and bicycle volumes generated by future background traffic growth and the project. The Saturday MD peak hour was determined to have the highest volumes of all modes of travel and should be considered the worst-case scenario for the W. Cliff Drive corridor. VISSIM microsimulation can account for lane changes, platoon effects, and variable arrival patterns and their impact to local access points and vehicles in neighboring lanes. VISSIM operates based on a time step, behavior-based stochastic model. Random seeds (varying traffic profiles) work with probabilistic inputs and the VISSIM driver/vehicle behavior model to generate each simulation.

Videos from the VISSIM simulation model are included with the “Intersection Planning Review and VISSIM Simulation” memorandum prepared by MSA (Ourston). The videos were produced at 2x speeds to help demonstrate a more complete visual depiction of the network operations within a two minute video. The qualitative discussion points developed by MSA (Ourston) are provided in Section 6.0 (Conclusions and Recommendations).

## Second Mini-Roundabout at W. Cliff Drive and Beach Street

During the initial process of developing a mini-roundabout alternative for the W. Cliff Drive / Bay Street intersection, City staff discussed the possibility of having a second mini-roundabout at the W. Cliff Drive / Beach Street intersection. At the request of City staff, MSA (Ourston) investigated the possibility of placing a second mini-roundabout at this location and determined that it was neither useful for operations of the corridor nor feasible. The intersection is currently operating under free flow conditions with the only delay occurring for vehicles crossing Beach Street from W. Cliff Drive and heading north, which is minimal. Converting the intersection to a mini-roundabout would only increase the delay for vehicles through the corridor and particularly at this intersection. In addition, this intersection is less than ideal to install a mini-roundabout due to the low angles where W. Cliff Drive and Beach Street intersect and the steep grade on Beach Street going toward the Santa Cruz Wharf. These constraints would likely cause operational issues, sight distance issues for vehicles and pedestrians and may cause rollover crashes for trucks.

## Santa Cruz Wharf Master Plan

Information in the Mitigated Negative Declaration / Initial study indicates that the implementation of the Wharf Master Plan would generate approximately 95 new vehicle trips during the weekday PM peak hour (57 entering and 38 exiting). The document also states that the additional trips at the Pacific Avenue / Beach Street intersection (roundabout) would result in maintaining acceptable peak hour LOS operations and the roundabout has sufficient reserve capacity to accommodate the growth potential of the Wharf Master Plan.

To evaluate the potential impact of the Wharf Master Plan on the cumulative (GP 2030) scenario evaluated in this TIA, the 95 additional PM peak hour trips were added to the Total Cumulative (GP 2030 Buildout) traffic volumes on Figures 5A and 5B. The Pacific Avenue / Beach Street intersection was again evaluated using the HCS7 software. The LOS analysis demonstrates that average vehicle delays would be 6.9 seconds per vehicle (LOS A), which is a slight increase over the 6.5 seconds per vehicle reported in Table 8 for the total cumulative scenario (City's GP 2030 Buildout plus the project traffic).

## 6.0 CONCLUSIONS AND RECOMMENDATIONS

As the analysis demonstrates, with implementation of any of the two (2) project variants the study intersections along W. Cliff Drive are expected to operate at an acceptable “level of service” (LOS). Traffic flows at the key intersection of W. Cliff Drive / Bay Street are expected to operate at LOS A-B, which is an improvement relative to existing conditions that operates at LOS E during the weekday PM peak hour. The project would also not contribute more than 3% to existing weekday PM peak hour traffic at this intersection, and therefore, would be considered to have a “less than significant” impact under the City’s thresholds of significance and the CEQA.

The City’s Public Works Department also requested that MSA (Ourston) provide a qualitative evaluation of the “pros” and “cons” of traffic signal control (Variant No.1 ) versus a mini-roundabout (Variant No. 2).

### **Pros and Cons of Alternative Intersection Controls along W. Cliff Drive, MSA (Ourston)**

The MSA (Ourston) findings suggest that each alternative carries costs and benefits, with the traffic signal alternative (Variant No. 1) providing better intersection performance, longer waits for pedestrians and bicyclists, and with slightly longer delays for vehicles during peak periods. The mini-roundabout alternative (Variant No. 2) provides improved corridor performance during non-peak periods and less delay during peak periods as compared with traffic signal control. Variant No. 2 also provides less delay for bikes and pedestrians and slower vehicular speeds through the intersection, which is desirable in this corridor context.

#### Variant No. 1: Traffic Signal at W. Cliff Dr. / Bay St. and RRFB at Mid-Block Crosswalk

Pros:

- Faster service for pedestrians using a RRFB - pedestrians don’t have to wait for a walk signal that requires nearby signal coordination
- Bicycle lanes are preserved (southbound W. Cliff Drive) and bicyclists will experience a greater sense of safety than at the mini-roundabout
- Fits within existing public right-of-way (ROW) - no impact to the project site footprint
- A positive exchange of ROW assignment for pedestrians at the Bay Street traffic signal gives greater security to pedestrians - a pedestrian’s perception of safety and clarity will be greater than at the mini-roundabout
- Pedestrian delay at the midblock crossing is comparable to the mini-roundabout alternative with the RRFB

Cons:

- Delay along eastbound Bay Street results in long queues
- Perpetuates existing weaving condition on southbound W. Cliff Drive, which creates vehicle conflicts in the mid-block between the mid-block RRFB and signal at Bay Street
- At times pedestrians can dominate the flow of traffic at the RRFB location and the signal, which may result in poor operations along the corridor

- A RRFB system at the mid-block crosswalk, causes inefficiencies at the Bay Street signal due to the random arrival of pedestrians at the crosswalk, which can affect W. Cliff Drive traffic when the Bay Street signal green is available
- Pedestrian delay may be higher than the mini-roundabout
- Vehicular speeds through the intersection may be higher

#### Variant No. 2: Mini-Roundabout at W. Cliff Dr. / Bay St. and RRFB at Mid-Block Crosswalk

Pros:

- Use of the RRFB at the midblock crosswalk gives priority to pedestrians and bikes crossing the roadway
- Pedestrians are given higher priority at all times
- Continuous flow between all modes of traffic results in better overall corridor capacity
- Speeds are lower through the corridor, owing to the crosswalks and the mini-roundabout
- Off peak operations of the mini-roundabout are generally more efficient than a traffic signal (e.g. more traffic responsive)

Cons:

- Bicycle lanes are provided on the approaches to a mini-roundabout. They should be terminated to alert motorists and bicyclists of the need for bicyclists to merge and share the travel lanes
- Perpetuates existing weaving condition on southbound W Cliff Dr, which creates vehicle conflicts in the mid-block between the RRFB and Bay Street
- At times pedestrians can dominate the flow of traffic at the RRFB location and the mini-roundabout, which may result in poor operations along the corridor
- Pedestrians and bicyclists may feel uncomfortable with the fluid operations of the mini-roundabout, which may result in hesitation to cross (raised crosswalks or speed tables are strongly recommended)
- ROW required from the project site

#### **MSA (Ourston) Conclusions**

1. It is evident from the VISSIM simulations that the W. Cliff Drive corridor, for either Variant No. 1 or 2, there will be times of queuing and delay on either one or multiple approaches along the corridor. This is the result of future growth in background traffic and the relatively close spacing of facilities in the corridor, including roadway intersections, driveway accesses, and pedestrian and bicycle crossings, all of which occur in a short distance.
2. The mini-roundabout alternative at Bay Street (Variant No. 2) has demonstrated that it has slightly improved overall corridor performance for vehicles, but some approaches may suffer from times of excess delay or pedestrian / bicycle demands. Without traffic signals to ‘meter’ pedestrian flow at the mid-block crossing, the high pedestrian volumes, at times, may dominate the flow of traffic at the RRFB and the mini-roundabout.

3. Choice of traffic control for a low speed pedestrian dominated environment must account for the demand of pedestrian flow and the expectations of pedestrians over the exchange of right-to-way (ROW) between vehicles and pedestrians. A positive exchange of ROW (Walk/Don't Walk signals) generates more certainty of the ability to cross. Accessibility of mobility challenged and visually impaired pedestrians depends on audible queues, the ability to stop vehicular traffic conditions and reasonable expectation of a gap in traffic. A traffic signal provides more certainty versus a mini-roundabout, despite its attractiveness in terms of overall operations.
4. Without additional traffic control devices to accommodate pedestrian crossings, such as raised crosswalks pedestrian and bicycle traffic at the mini-roundabout intersection will not be afforded the same level of safety as a conventional roundabout due to the absence of geometric speed control on the Variant No. 2 mini-roundabout. Roundabouts by design are intended to slow traffic as it approaches and crosses the intersection. Speed reduction relies on effective geometry, which is dependent on the size and shape of the roundabout. The design proposed is not as effective at speed control as a larger roundabout but is still slower by comparison to a traffic signal (except when the lights are red). There is not sufficient space to introduce geometric speed control here as at conventional roundabouts.
5. In terms of overall performance for all users, the signal system gives more certainty to all its users, though has more delay than the mini-roundabout variant; users will experience a greater perception of safety and certainly of crossing the intersection.
6. For bicyclists and pedestrians, signal control provides a perception of certainty of crossing accommodation including for disabled and visually impaired. Pedestrians feel less safe at roundabouts despite the opposite statistics.
7. Modeling of the future operations as a network showed that the Wharf roundabout would not suffer operationally in either of the Variants No. 1 or 2.

## **Appendix B**

- Level of Service (LOS) LOS Descriptions
- Synchro and HCM Software (HCS7) “Level of Service” (LOS) Worksheets

The ability of a highway system to carry traffic is expressed in terms of its "Service Level" at critical locations, usually intersections. Service levels are defined as follows:

- "LOS A" Conditions primarily describe free-flowing operations. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at the boundary intersections is minimal. The travel speed exceeds 85% of the base free-flow speed.
- "LOS B" Conditions describe reasonably unimpeded operations. The ability to maneuver within the traffic stream is only slightly restricted and control delay at the boundary intersections is not significant. The travel speed is between 67% and 85% of the base free-flow speed.
- "LOS C" Conditions describe stable operations. The ability to maneuver and change lanes at mid-segment locations may be more restricted than at LOS B. Longer queues at the boundary intersections may contribute to lower travel speeds. The travel speed is between 50% and 67% of the base free-flow speed.
- "LOS D" Conditions describe less stable operations in which small increases in flow may cause substantial increases in delay and decreases in travel speed. This operation may be due to adverse signal progression, high volume, or inappropriate signal timing at the boundary intersections. The travel speed is between 40% and 50% of the base free-flow speed.
- "LOS E" Conditions describe unstable operations and significant delay. Such operations may be due to some combination of adverse progression, high volume, and inappropriate signal timing at the boundary intersections. The travel speed is between 30% and 40% of the base free-flow speed.
- "LOS F" Conditions describe flow at extreme low speed. Congestion is likely occurring at the boundary intersections, as indicated by high delay and extensive queuing. The travel speed is 30% or less of the base free-flow speed. Also, LOS F is assigned to the subject direction of travel if the through movement at one or more boundary intersections has a volume-to-capacity (V/C) ratio greater than 1.0.

Table 5-P: Computations Summary

	Total	Entering	Exiting
All Person-Trips	440	231	209
Internal Capture Percentage	10%	10%	11%
External Vehicle-Trips <sup>5</sup>	174	91	83
External Transit-Trips <sup>6</sup>	0	0	0
External Non-Motorized Trips <sup>6</sup>	0	0	0

Table 6-P: Internal Trip Capture Percentages by Land Use

Land Use	Entering Trips	Exiting Trips
Office	N/A	33%
Retail	60%	35%
Restaurant	13%	29%
Cinema/Entertainment	N/A	N/A
Residential	N/A	N/A
Hotel	3%	3%

<sup>1</sup>Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

<sup>2</sup>Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

<sup>3</sup>Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

<sup>4</sup>Enter vehicle occupancy assumed in Table 1-P vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made.

<sup>5</sup>Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P.

<sup>6</sup>Person-Trips

\*Indicates computation that has been rounded to the nearest whole number.

NCHRP 684 Internal Trip Capture Estimation Tool					
Project Name:	190 W. Cliff Dr. Mixed Use Project		Organization:	Pinnacle Traffic Engineering (PTE)	
Project Location:	City of Santa Cruz, CA		Performed By:	LDH	
Scenario Description:	Mixed-Use Development		Date:	1/17/2019	
Analysis Year:	2019		Checked By:	LDH	
Analysis Period:	Weekday PM Street Peak Hour		Date:	1/17/2019	

Table 1-P: Base Vehicle-Trip Generation Estimates (Single-Use Site Estimate)

Land Use	Development Data (For Information Only)			Estimated Vehicle-Trips <sup>3</sup>		
	ITE LUCs <sup>1</sup>	Quantity	Units	Total	Entering	Exiting
Office	#710	1,646	SF	2	0	2
Retail	#826	8,265	SF	23	10	13
Restaurant	#931	7,525	SF	57	38	19
Cinema/Entertainment				0		
Residential	#230	89	Condos	73	49	24
Hotel	#310	165	Rooms	115	56	59
All Other Land Uses <sup>2</sup>				0		
				270	153	117

Table 2-P: Mode Split and Vehicle Occupancy Estimates

Land Use	Entering Trips			Exiting Trips		
	Veh. Occ. <sup>4</sup>	% Transit	% Non-Motorized	Veh. Occ. <sup>4</sup>	% Transit	% Non-Motorized
Office	1.25			1.25		
Retail	1.50			1.50		
Restaurant	2.00			2.00		
Cinema/Entertainment						
Residential	1.25			1.25		
Hotel	2.50			2.50		
All Other Land Uses <sup>2</sup>	1.50			1.50		

Table 3-P: Average Land Use Interchange Distances (Feet Walking Distance)

Origin (From)	Destination (To)					
	Office	Retail	Restaurant	Cinema/Entertainment	Residential	Hotel
Office						
Retail						
Restaurant						
Cinema/Entertainment						
Residential						
Hotel						

Table 4-P: Internal Person-Trip Origin-Destination Matrix\*

Origin (From)	Destination (To)					
	Office	Retail	Restaurant	Cinema/Entertainment	Residential	Hotel
Office		1	0	0	0	0
Retail	0		6	0	5	1
Restaurant	0	8		0	7	3
Cinema/Entertainment	0	0	0		0	0
Residential	0	2	6	0		1
Hotel	0	0	4	0	0	

Table 5-P: Computations Summary

	Total	Entering	Exiting
All Person-Trips	531	292	239
Internal Capture Percentage	17%	15%	18%
External Vehicle-Trips <sup>5</sup>	218	126	92
External Transit-Trips <sup>6</sup>	0	0	0
External Non-Motorized Trips <sup>6</sup>	0	0	0

Table 6-P: Internal Trip Capture Percentages by Land Use

Land Use	Entering Trips	Exiting Trips
Office	N/A	33%
Retail	73%	60%
Restaurant	21%	47%
Cinema/Entertainment	N/A	N/A
Residential	20%	30%
Hotel	4%	3%

<sup>1</sup>Land Use Codes (LUCs) from *Trip Generation Manual*, published by the Institute of Transportation Engineers.

<sup>2</sup>Total estimate for all other land uses at mixed-use development site is not subject to internal trip capture computations in this estimator.

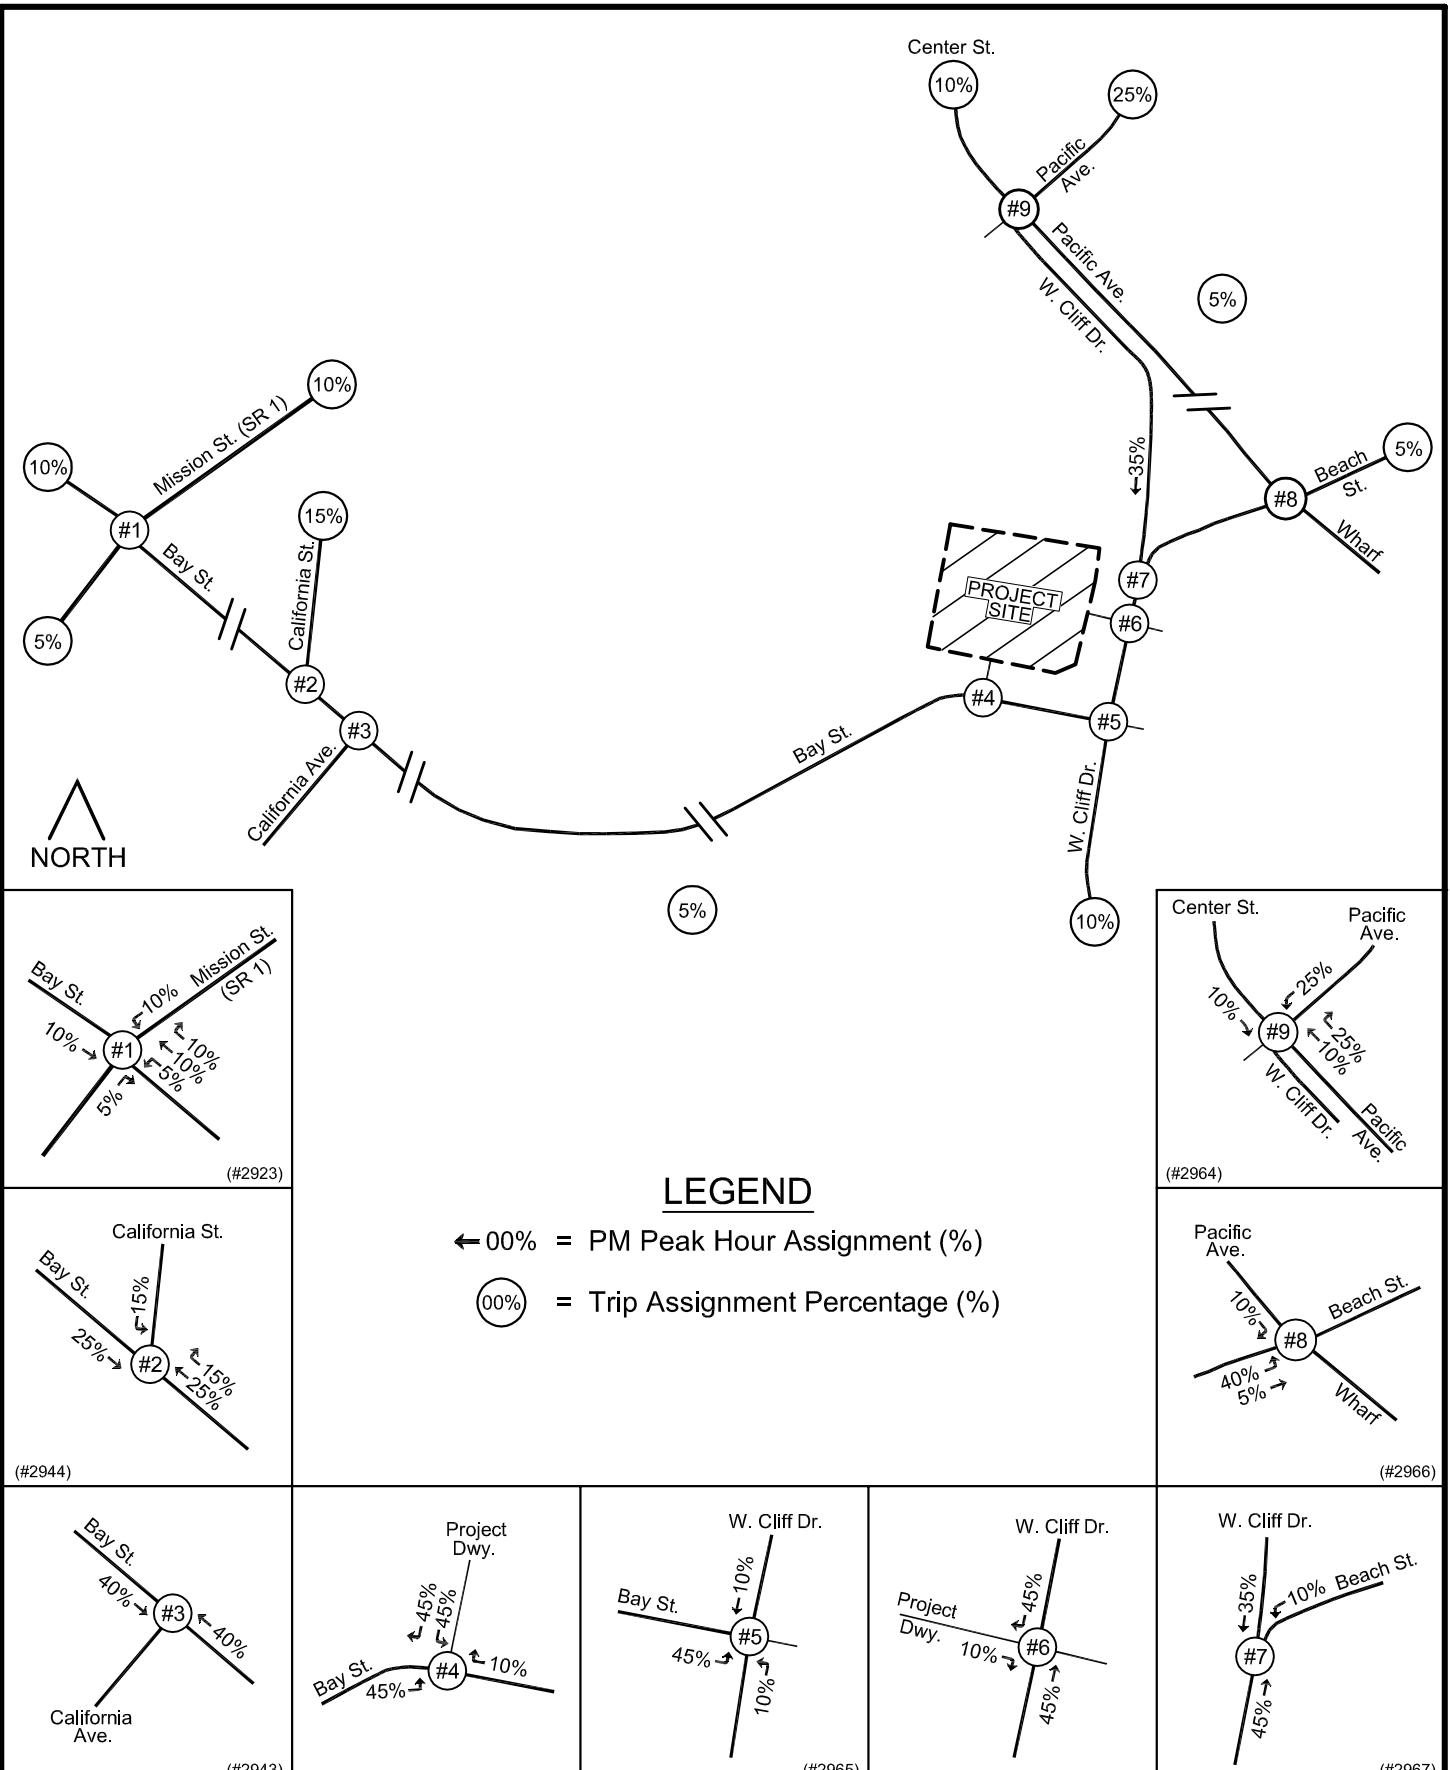

<sup>3</sup>Enter trips assuming no transit or non-motorized trips (as assumed in ITE *Trip Generation Manual*).

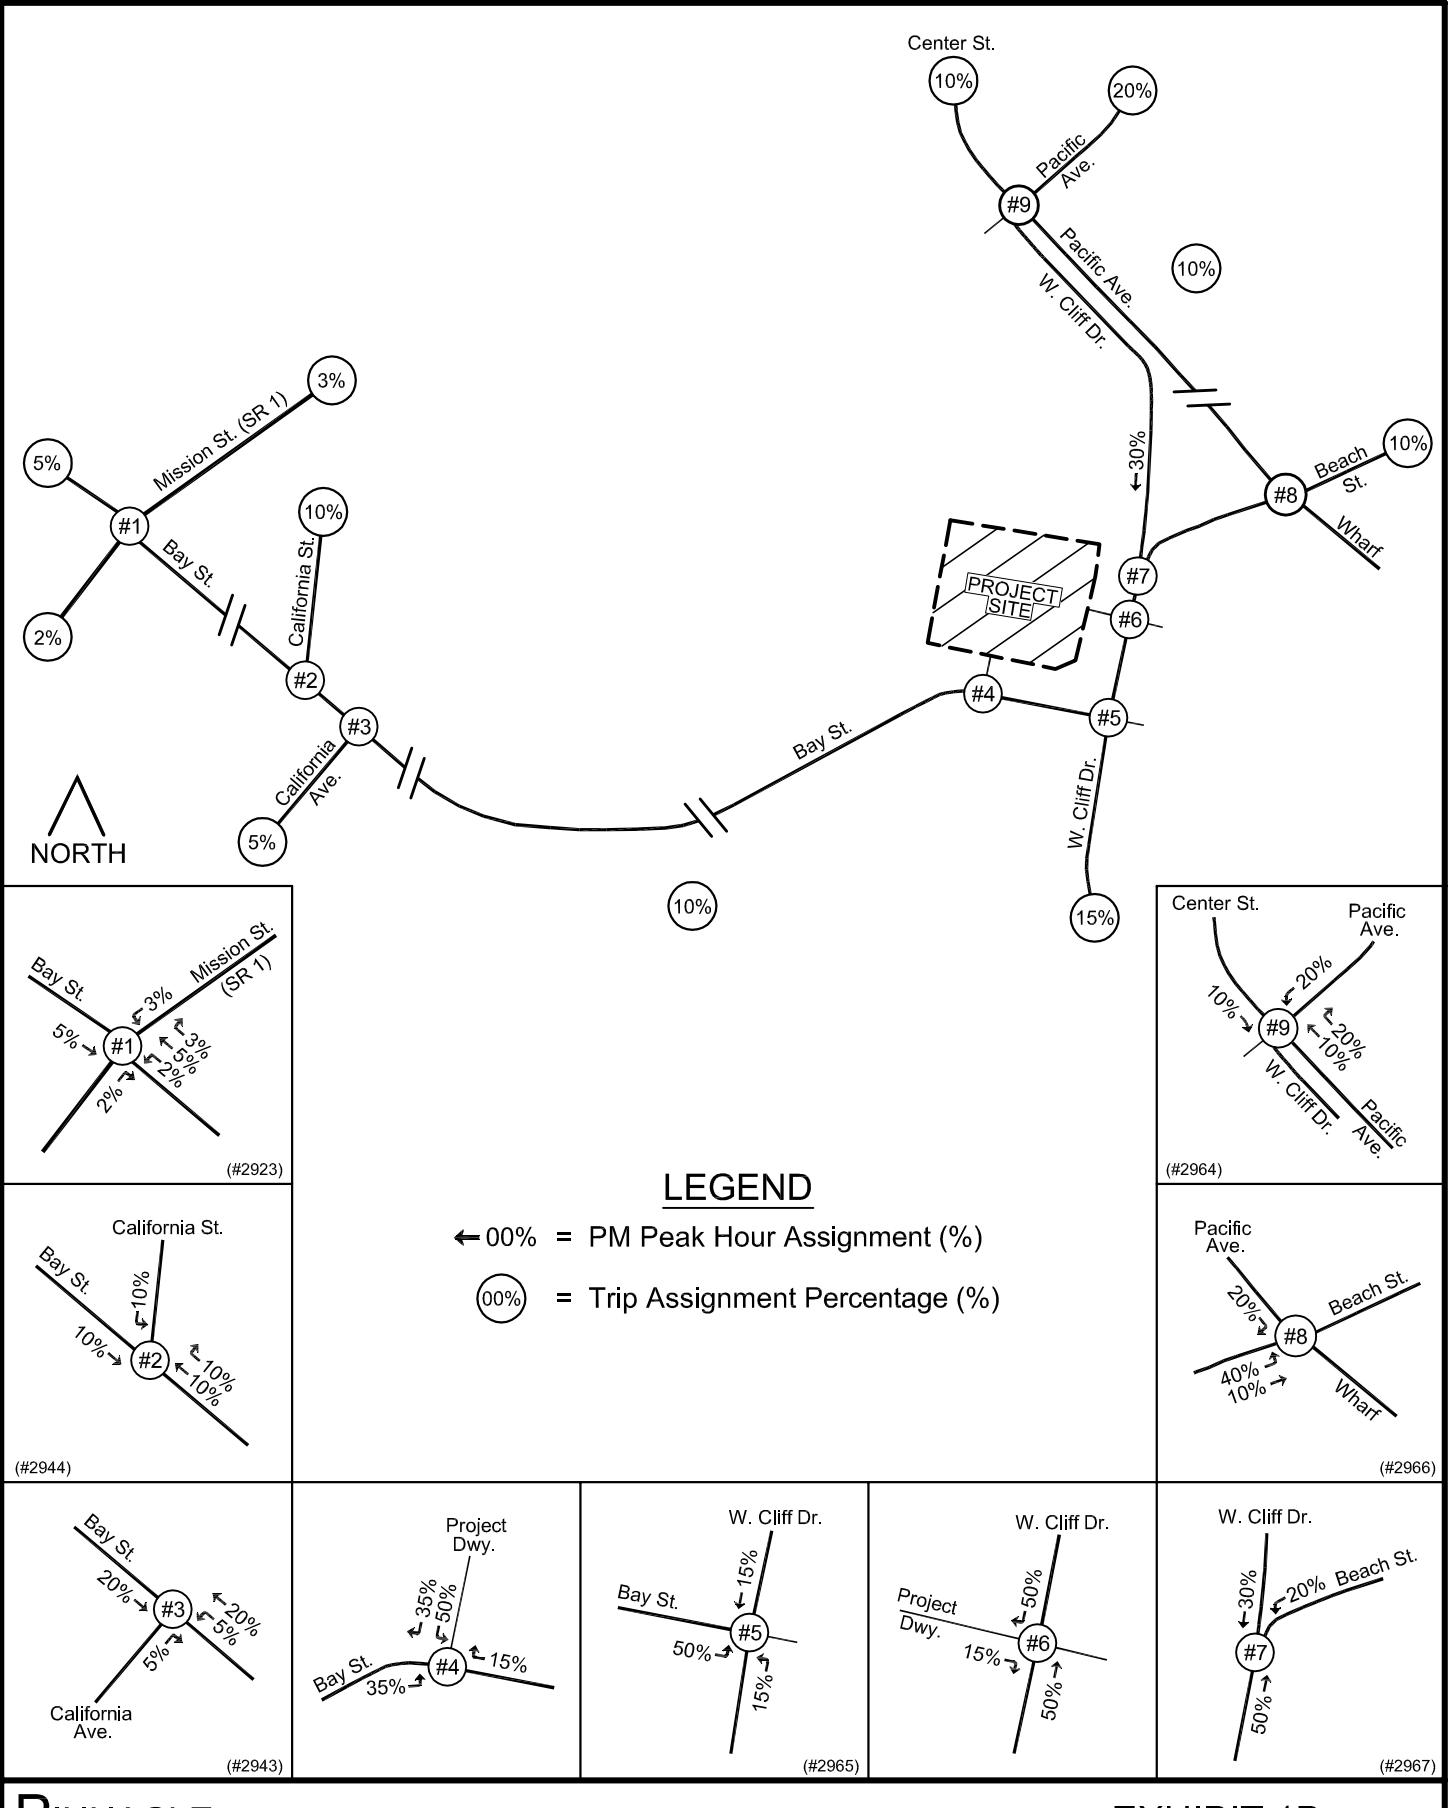

<sup>4</sup>Enter vehicle occupancy assumed in Table 1-P vehicle trips. If vehicle occupancy changes for proposed mixed-use project, manual adjustments must be made.

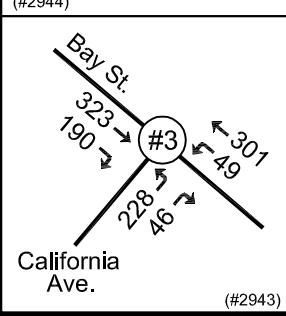

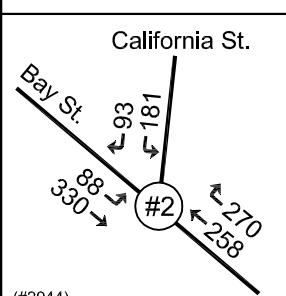

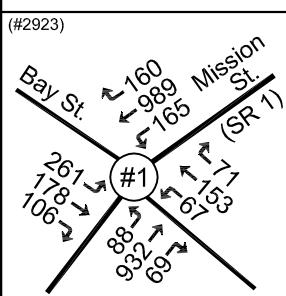

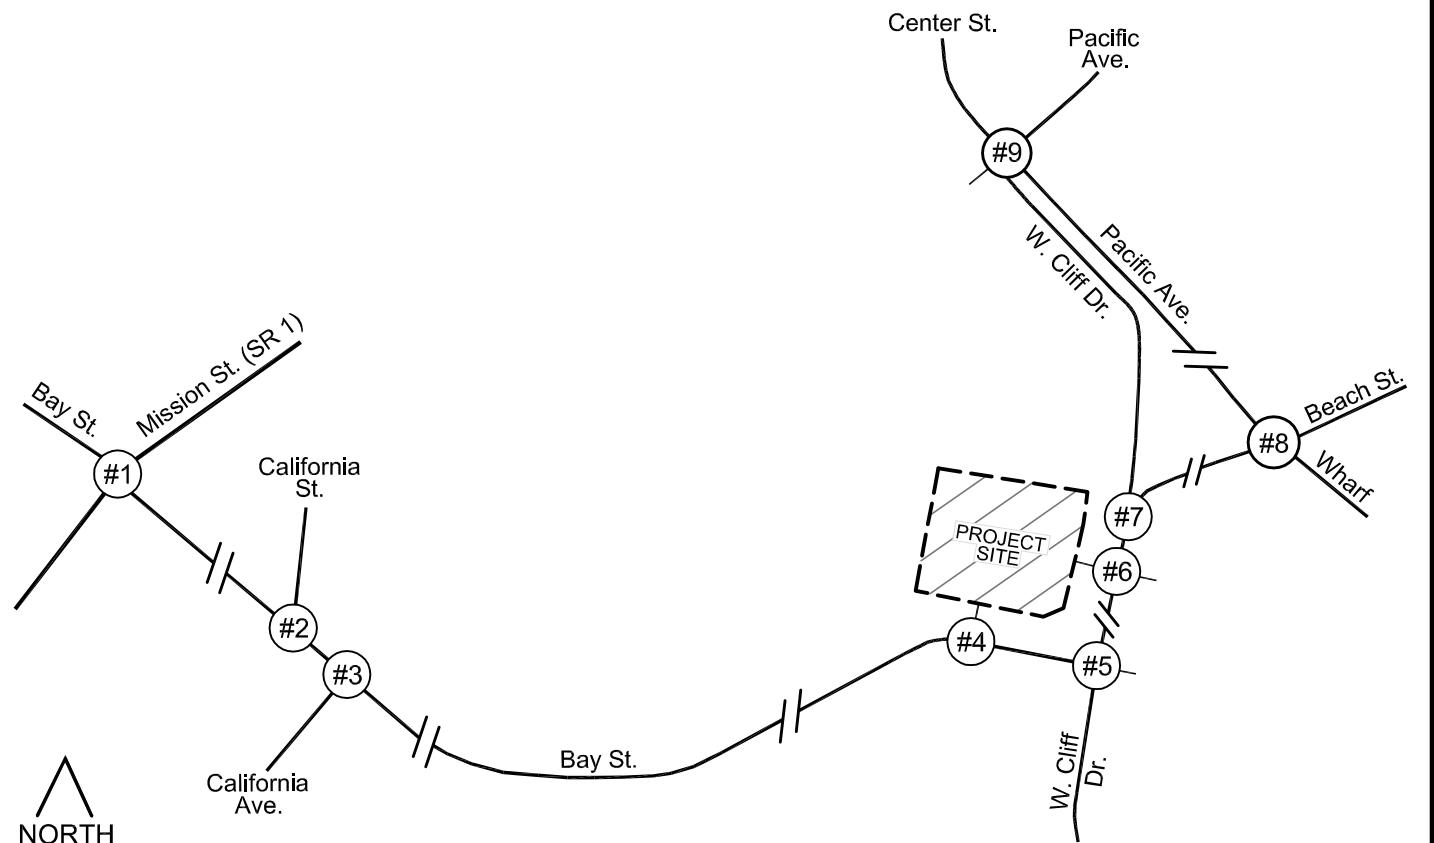

<sup>5</sup>Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P.

<sup>6</sup>Person-Trips

\*Indicates computation that has been rounded to the nearest whole number.
